CREATING AN IDEAL LIGHTING SPACE FOR THE WORLD

ABOUT COLORS

HUACAI OPTO CO., LTD. (COLORS), founded in 2008, is a national high-tech enterprise specializing in LED lighting. It has incubated a forefront-ranked brand-COLORS in the segmented domain, proficient in providing comprehensive lighting solutions for residential, office, commercial scenarios and the like,

SINCE
2008
Dedicated to Lighting Excellence
Since 2008, we have continuously advanced our expertise, now standing as the industry leader in this specialized field.

Group Company
Headquartered in Shenzhen, and more branches layout in the Yangzhou and Jiangmen.

Production Base
2 self-established factories in Yangzhou and Jiangmen, covering an area of 45,000m².
Featured in stable high-quality, strong production capacity and quick delivery.

Product System
The full product system includes led strips, neon strips, linear lights, track lights and downlights.
Proficient in providing comprehensive lighting solution for residential, office,commercial scenes etc.

Certification System
Qualified for ISO9001 Quality System Certification, ISO14001 Environmental System Certification and product certifications inclusive of CE, UL and CCC etc.

Independent R&D
Sticks to independent R&D and intellectual property management. Qualified for the title of National High-tech Enterprise, and repeatedly gained international design awards inclusive of IF, IDEA, RED DOT and GOLDEN PIN etc.

International Brand
Registered trademarks in 30 countries and regions worldwide and carried out more than 20 promotional tours throughout the year. Brand partners are worldwide distributed.

Global Market
Products are exported to over 100 countries and regions worldwide. Dominates the European market and cooperates with many major well-known brands.

ARCHITECTURAL FACADE LIGHTING

Definition

Architectural facade lighting is a technical approach involving systematic lighting design for the external surfaces of buildings using artificial light sources. Its primary objectives are to reshape a building's nighttime image through artistic expressions of light, highlight its morphological features, material textures, and cultural connotations, while achieving harmonious coexistence with the urban environment.

Core Elements

Integrating technical factors such as luminaire selection, beam control, and installation craftsmanship, methods like spotlighting, backlighting, contour lighting, focal point lighting, and dynamic lighting are employed. Through light-shadow contrast, dynamic changes, and color coordination, these techniques endow buildings with nighttime "personalities," while concurrently fulfilling goals such as safety guidance, environmental harmony, and energy consumption control.

Key Values

Aesthetic Value :Reinforcing the interpenetration of modern architectural volumes through floodlighting. Highlighting material details via grazing light. Enabling architectural "expression" changes through programmable LED systems.

Functional Value :Enhancing cornice lines with horizontal separation lighting to guide pedestrian visual flow. Integrating emergency lighting systems with primary lighting to ensure critical path recognizability during emergencies.

Economic Value :Premium lighting design can increase commercial building rents by 15%-20%, enhancing asset value through improved aesthetics. Smart control systems (e.g., DALI protocol) enable time-division and zone-based management, reducing long-term operation and maintenance costs.

Social Value :Urban street lighting renovations strengthen residents' sense of belonging and sustain community cultural identity and cohesion. Interactive projections showcasing architectural history and humanities serve public education purposes.

Technological Iteration Value :Integration of flexible perovskite photovoltaic films with luminaires achieves "grid-independent" lighting, driving material innovation. Adoption of digital twin technology to build city-level light-shadow simulation systems, fostering a harmonious nighttime light environment between humans and nature.

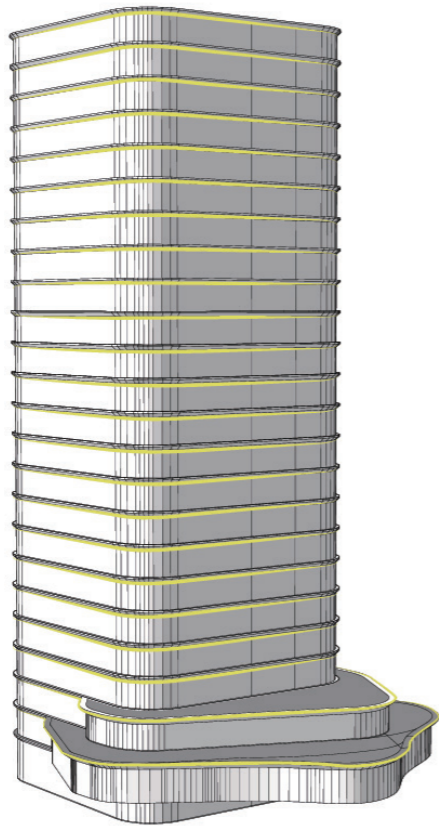

ARCHITECTURAL FACADE LIGHTING

High-Rise Landmark Buildings

As "urban regional landmarks", the design emphasizes enhancing architectural height and massing through lighting, while balancing energy efficiency and light pollution control. Dynamic lighting and intelligent control systems are mainstream trends, enabling diverse visual effects from festival-themed dynamics to daily ambient gradients. Prioritizes vertical illuminance and uniformity, balancing overall building brightness with local details to avoid glare affecting the surrounding environment.

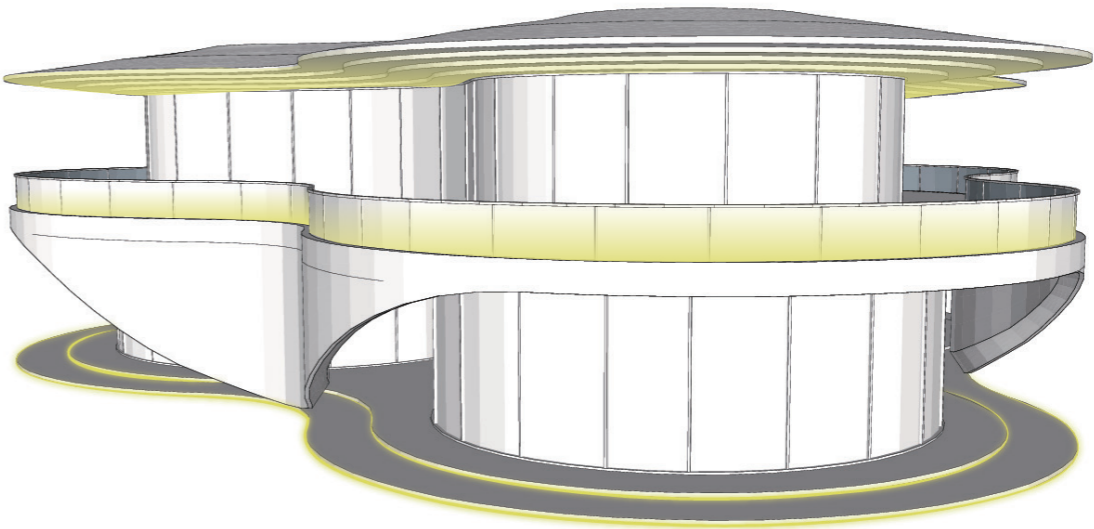

Adopts "Contour Lighting + Flood Lighting", using linear lights along rooftops and edges combined with long-range projection to create a clear urban skyline. Implements intelligent dimming to automatically adjust brightness and dynamic effects by time slots. Requires high-efficiency luminaires with professional light distribution to minimize diffused light pollution and achieve energy conservation.

Public Cultural Buildings

Core Concept: Serving as "carriers of public life", the design restores architectural texture through precise projection while integrating cutting-edge lighting technologies for cultural storytelling. Non-contact projection and dynamic light art are trending, with long-range lighting preserving original structures and inner transmission lighting connecting indoor-outdoor spaces. Focuses on flexible multi-mode lighting to balance architectural functions, public safety, and humanistic care.

Uses "Façade Projection + Under-Eave Flooding + Grazing Lighting" to highlight material textures and architectural temperament. Integrates projection technology for cultural narratives (e.g., historical scroll projections on museum facades). Employs concealed design, hiding luminaires within architectural structures or components to achieve a "no visible fixtures during daytime" effect.

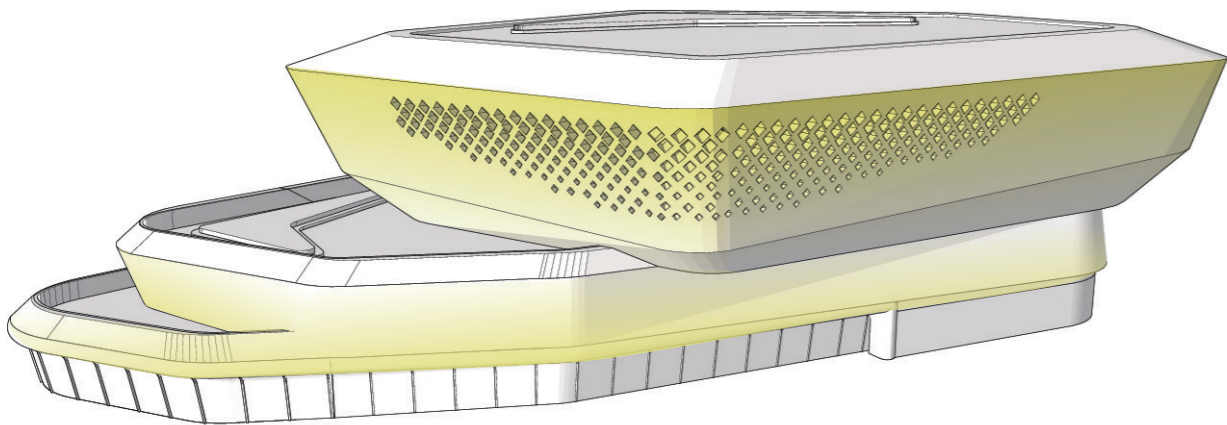

ARCHITECTURAL FACADE LIGHTING

Commercial Block Buildings

Design Objective: Oriented toward "consumer attraction", the design stimulates commercial vitality through dynamic lighting and interactive experiences. Multi-dimensional light environment design (color temperature zoning, brightness gradients) and creating harmonious blends of nature and urban ambiance are emerging trends. Enhances vertical illuminance for window displays and guides customer flow via dynamic lighting to improve shopping experiences.

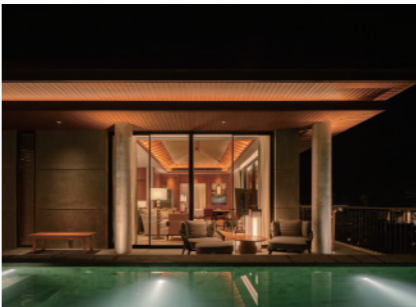

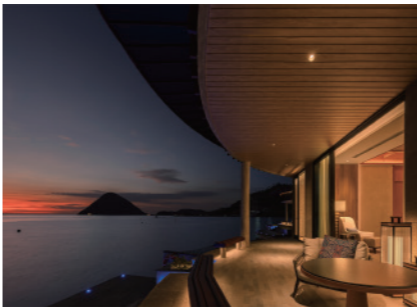

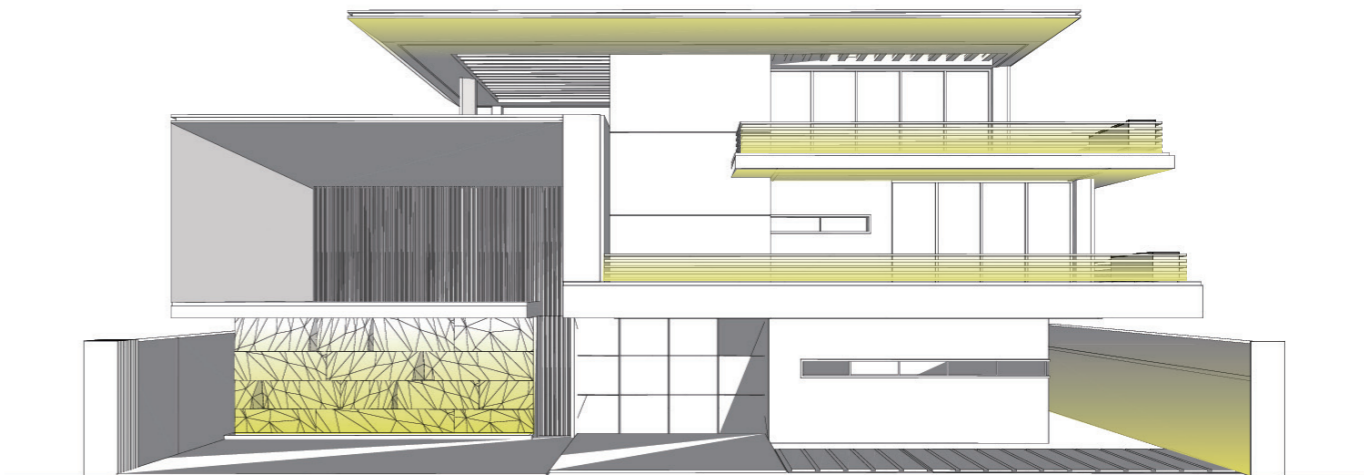

Creates layered facade environments with varying color temperatures (e.g., warm 3000K for podium zones vs. cool 4000K for towers). Installs touch-sensitive screens or dynamic light games for interactive engagement. Utilizes natural light sensors and time-sharing control to reduce energy consumption during non-business hours.

Low-Rise Residential Buildings

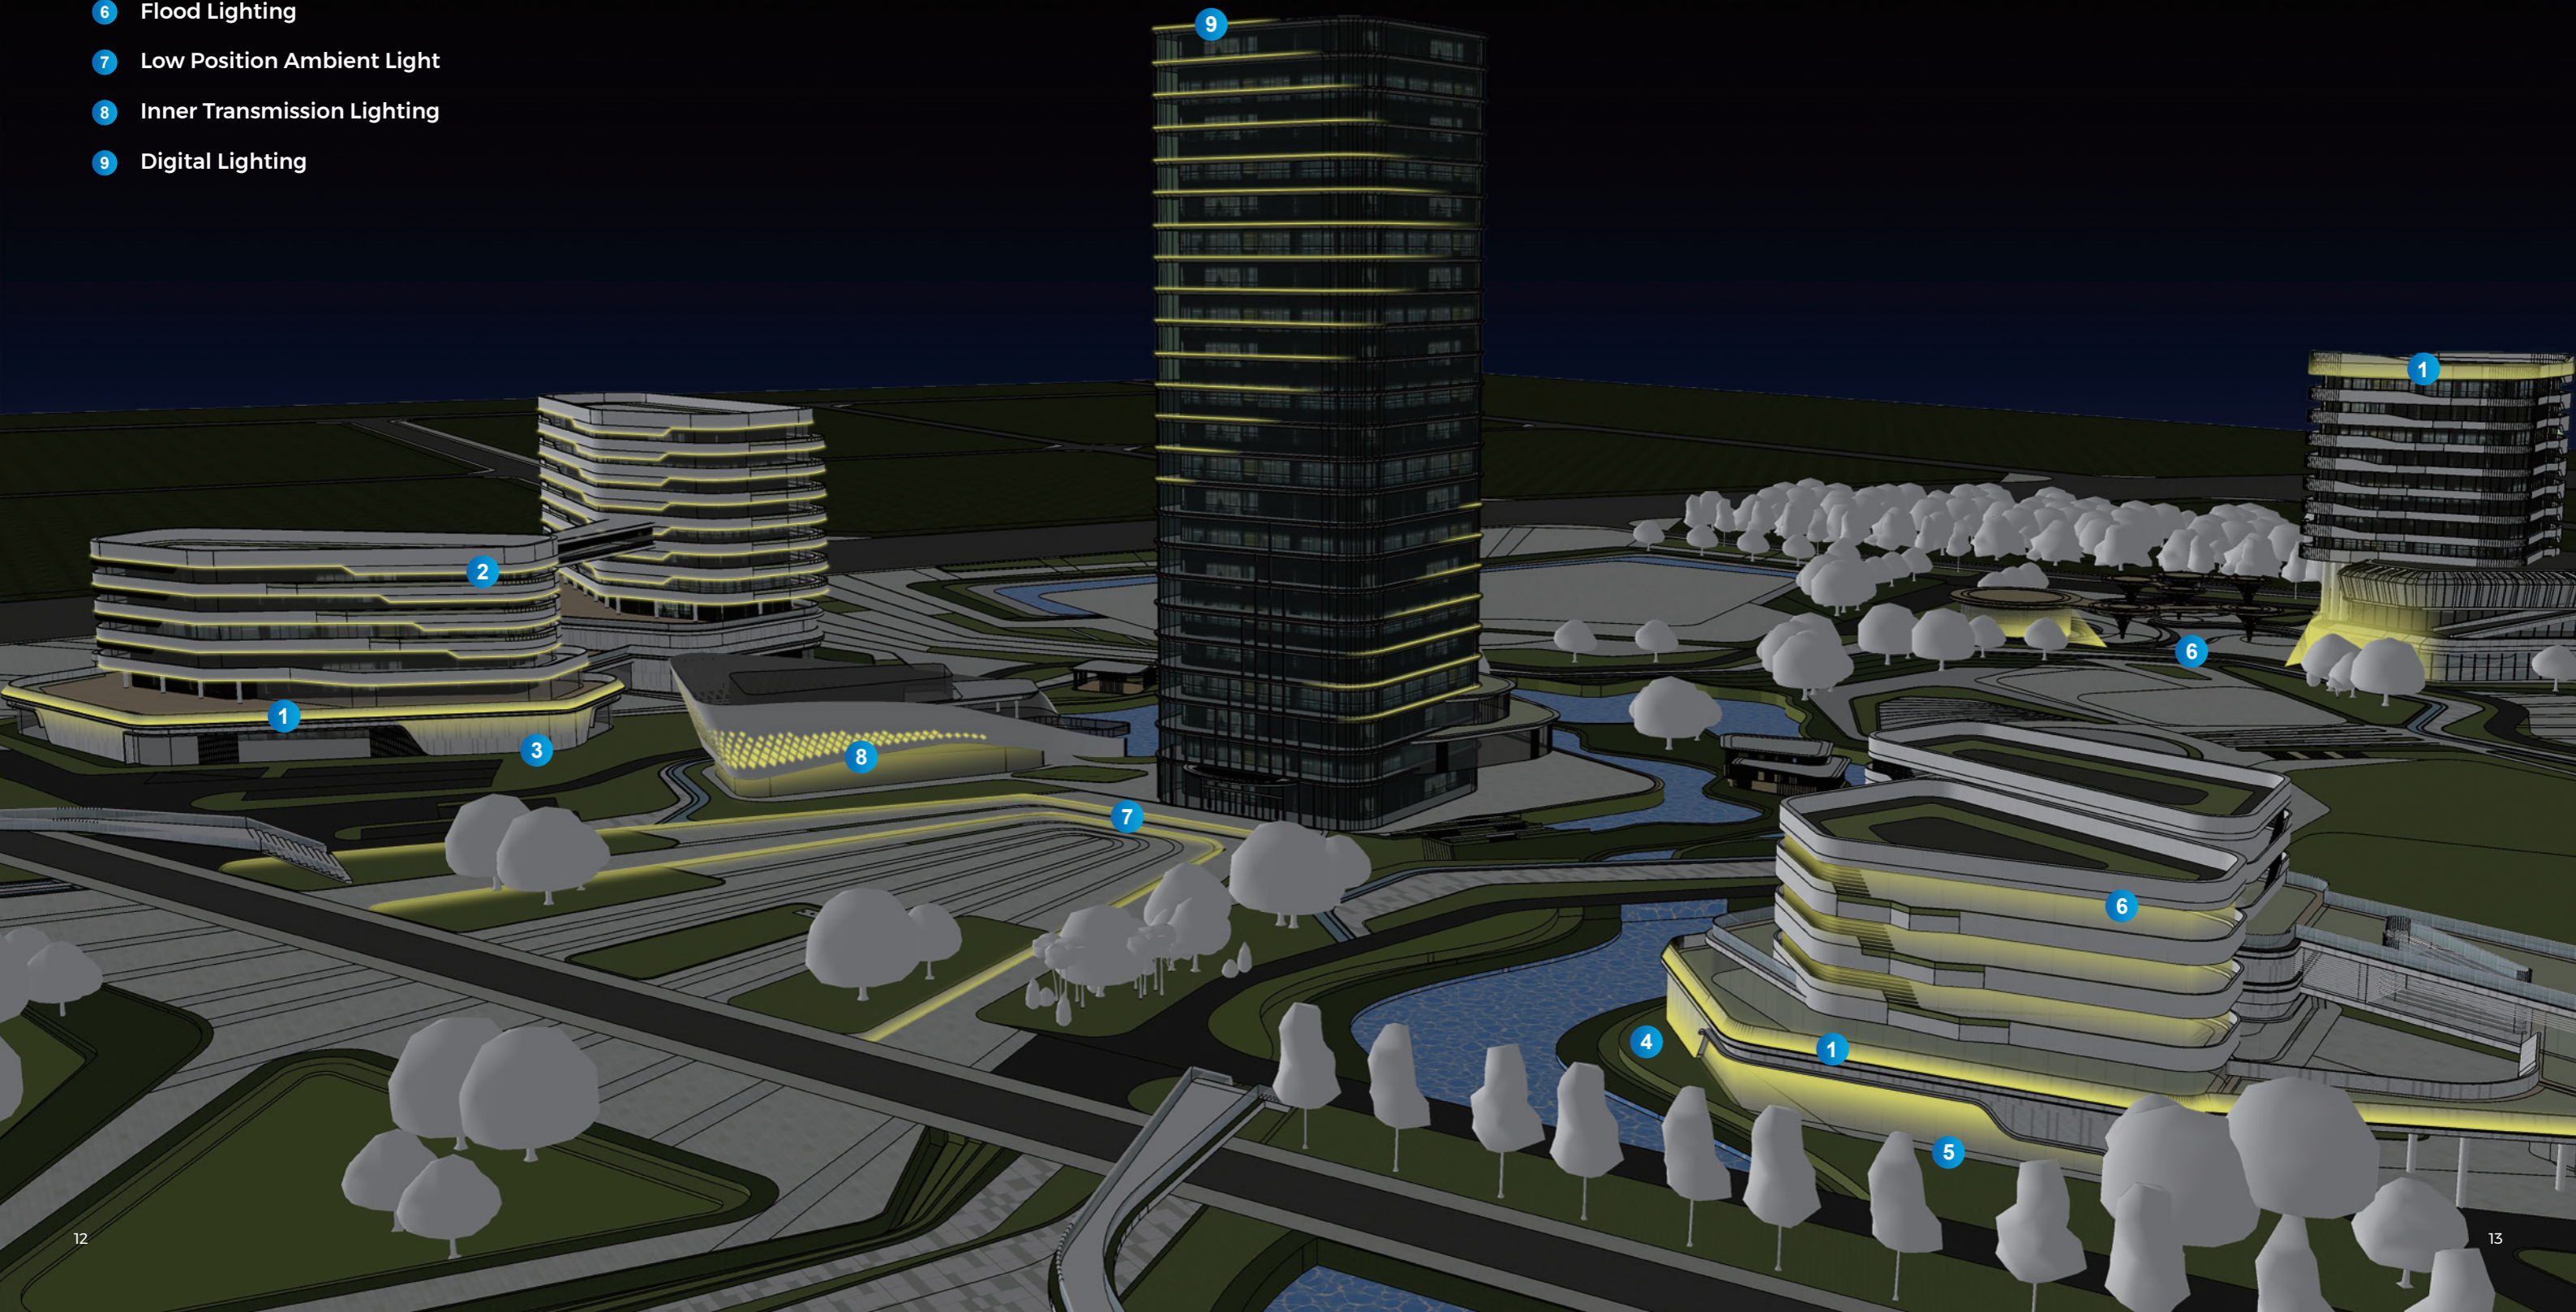

Core Focus: Centered on "livable living experiences", the design uses soft lighting to create privacy and a sense of belonging. Personalized customization and smart security lighting are mainstream, with linear light strips and motion-sensor lighting commonly used in villa designs. Balances functionality and aesthetics, avoiding excessive 亮化 (brightening) that invades privacy, while integrating luminaires with architectural materials.

Employs multi-layered lighting: indirect light for facades and low-position ambient lighting for courtyards to avoid glare. Matches lighting techniques to architectural styles (e.g., linear light strips for modern villas). Implements intelligent control with motion sensors and natural light adjustment for energy-efficient "auto-on/off" functionality.

ILLUMINATION APPROACH FOR BUILDING FACADES

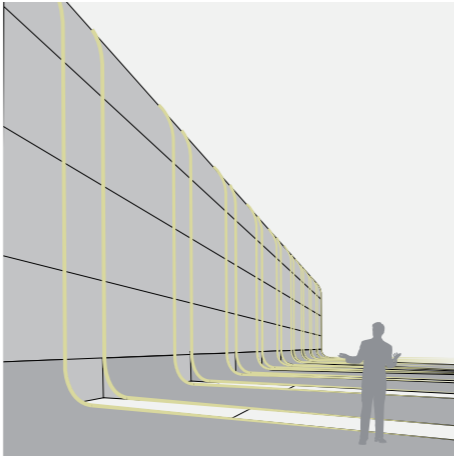

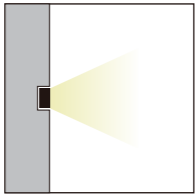

- 1 Under Eave Lighting
- 2 Contour Lighting
- 3 Cove Lighting
- 4 Facade Grazing Light-Upwards
- 5 Facade Grazing Light-Downwards
- 6 Flood Lighting
- 7 Low Position Ambient Light
- 8 Inner Transmission Lighting
- 9 Digital Lighting

INSTALLATION NODES IN LIGHTING DESIGN

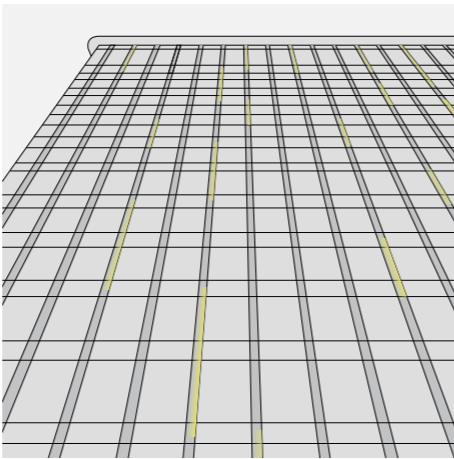

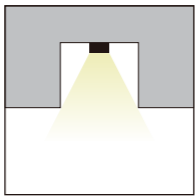

Contour Lighting

Using linear lights along building edges or object perimeters to outline shapes through light-dark contrast. Functionally enhances nighttime shape recognition with a minimalist visual effect, characterized by "light as line" abstraction. Applicable to roof eaves, bridge railings, sculpture frames, etc., commonly seen in urban landmarks (e.g., skyscraper top contours) and ancient architecture cornice lighting.

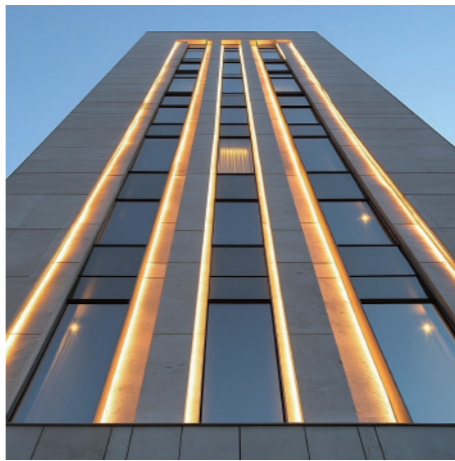

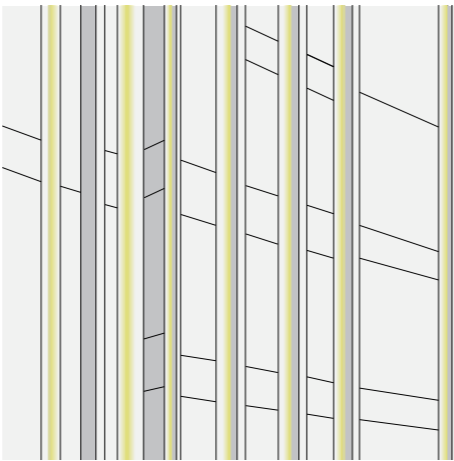

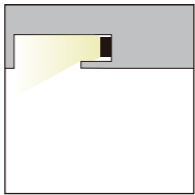

Digital Lighting

Using programmable LED fixtures (pixel lights, wall washer matrices, RGB strips) to achieve dynamic effects (color changes, pattern flows, rhythmic flashing) via control software. Enhances interactivity and timeliness, creating immersive experiences. Fits commercial facades, theme parks, and festival venues, often paired with music/video for light shows.

Cove Lighting

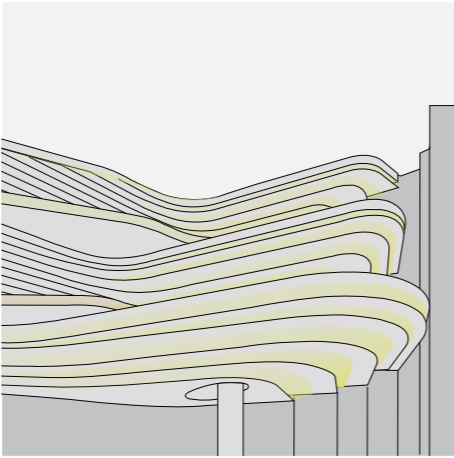

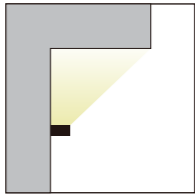

Hiding light sources in architectural recesses (e.g., ceiling coves or facade slots) to create indirect lighting via reflection/diffusion. Provides soft ambient light, reduces direct glare, and builds subtle spatial layers. Highlights the "light without fixtures" concealment, enhancing softness with diffusive materials. Suitable for indoor/outdoor ceiling edges, structural recesses, handrail interiors, and landscape retaining walls requiring indirect lighting.

INSTALLATION NODES IN LIGHTING DESIGN

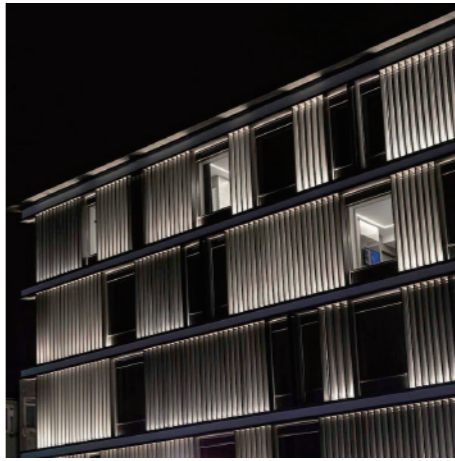

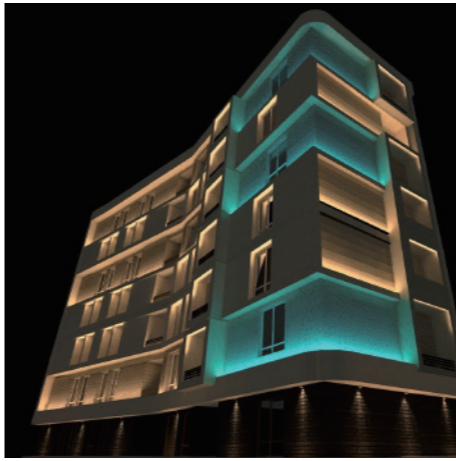

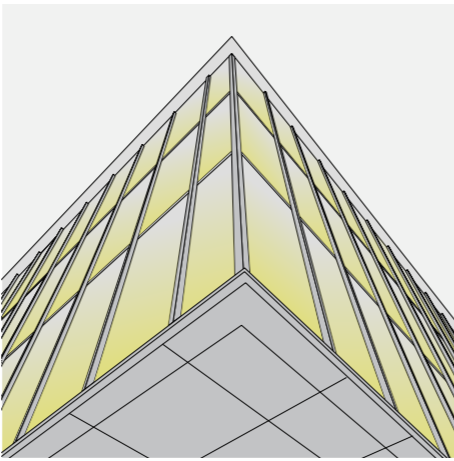

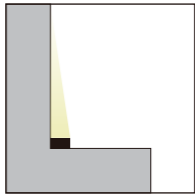

Under Eave Lighting

Installing projectors under or inside building eaves to cast upward/outward light on cornice details (e.g., brackets, decorative moldings). Enhances top-layer hierarchy of facades and balances vertical brightness ratios. Features light-shadow contrast to emphasize cornice three-dimensionality, ideal for ancient architecture eaves or modern cantilever structures.

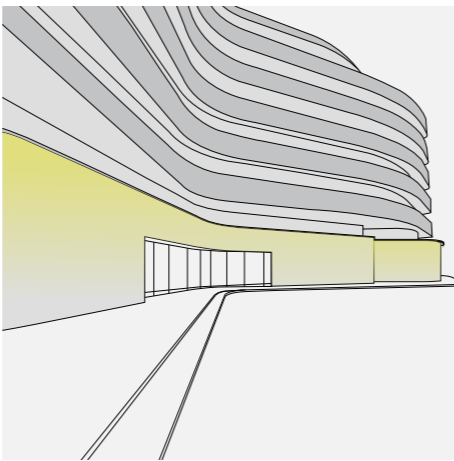

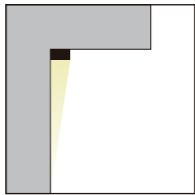

Facade Grazing Light-Upwards

Positioning fixtures near wall bases to project narrow beams upward, emphasizing texture undulations via inverse light-shadow contrast, especially for bottom details. Creates dramatic effects with bottom-up lighting, ideal for museum exteriors, religious building pedestals, or modern art installations.

Facade Grazing Light-Downwards

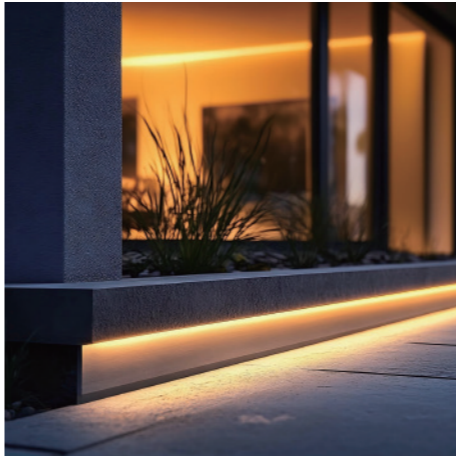

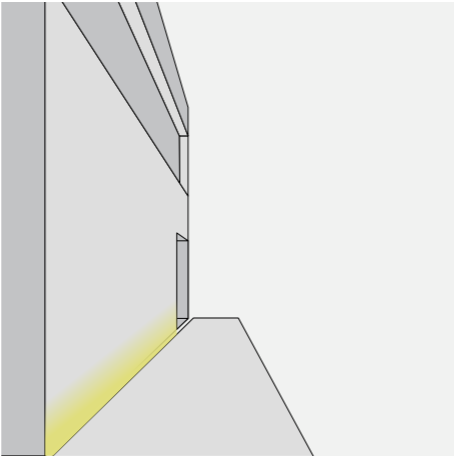

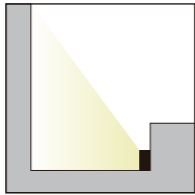

Mounting fixtures close to wall tops to project narrow beams downward, revealing concave-convex textures (e.g., brick joints, reliefs) through subtle shadowing. Strengthens tactile perception of rough materials (stone, concrete, handcrafted bricks), suitable for historic building restorations and cultural venue facades.

INSTALLATION NODES IN LIGHTING DESIGN

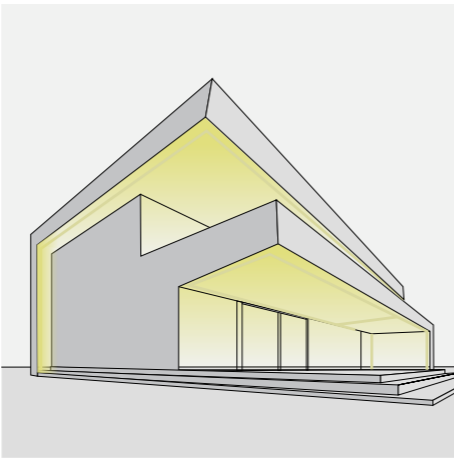

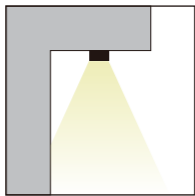

Low Position Ambient Light

Using low-mounted fixtures (ground lights, step lights, lawn lamps) to emit soft, glare-free light for near-ground comfort. Enhances pedestrian safety and approachability in slow-paced environments. Applies to walkways, hotel courtyards, and residential gardens, often layered with high-mast lighting for vertical illuminance gradients.

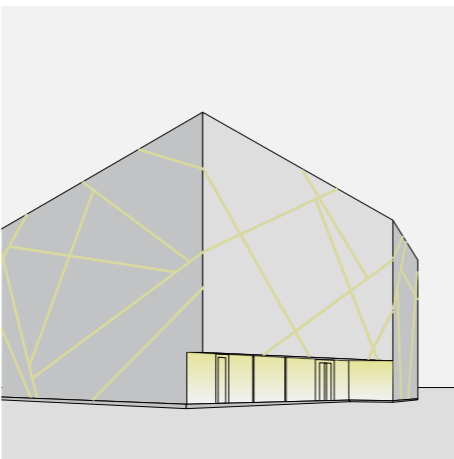

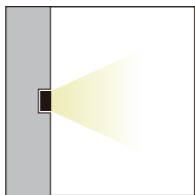

Flood Lighting

Using high-power floodlights to evenly illuminate a large area, providing base ambient lighting, and meeting functional visual needs. Features include wide coverage, uniform brightness, and emphasis on overall form over local details. Suitable for squares, parking lots, stadiums, and large open spaces, highlighting the volume of industrial buildings or warehouses.

Stylish Lighting

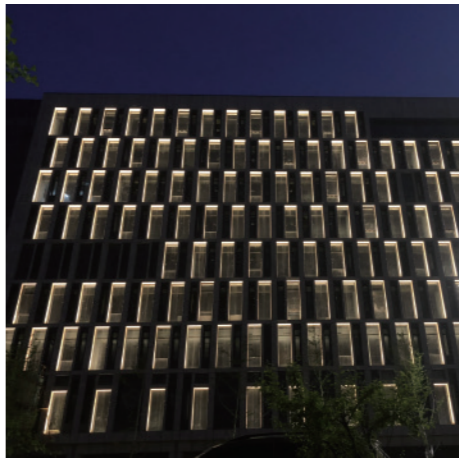

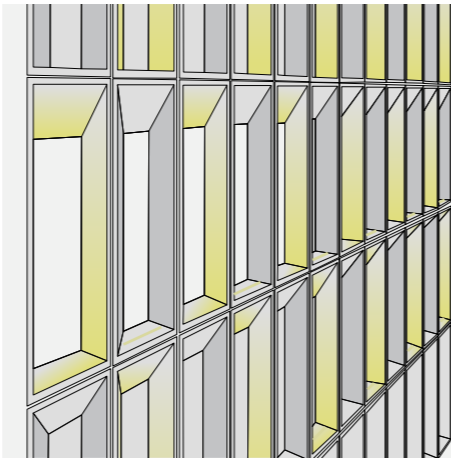

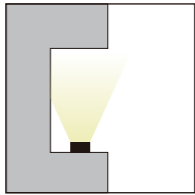

Breaking traditional fixture forms to create artistic light installations (e.g., biomimetic lamps, light sculptures, modular designs), emphasizing creativity and spatial storytelling. "Fixtures as art" integrates aesthetics and functionality, applied to building facades, cultural parks, public art spaces, and luxury hotel lobbies.

INSTALLATION NODES IN LIGHTING DESIGN

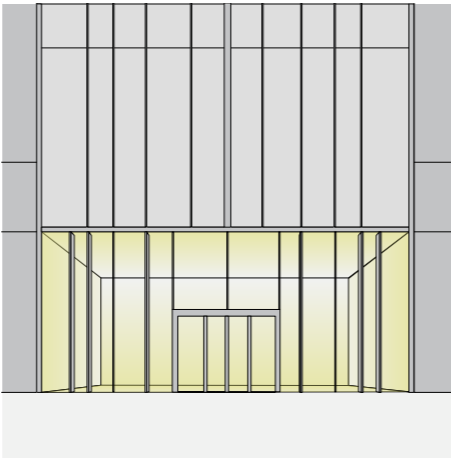

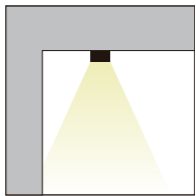

Window Frame Lighting

Illuminating all four sides (top/bottom/left/right) of window frames with recessed linear lights or mini projectors to enhance structural rhythm and 3D layers. Transforms windows into facade focal points, improving nighttime readability of details. Features brightness differentiation (front sides highlighted, sides recessed) for depth, suitable for commercial complexes and libraries with high window-wall ratios.

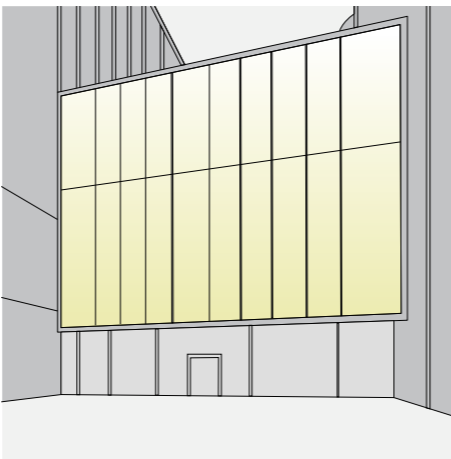

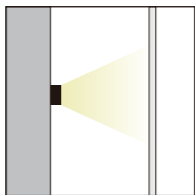

Inner Transmission Lighting

Placing light sources inside objects (e.g., glass curtain wall cavities) to emit light through translucent materials (glass, acrylic, silk), creating a light and airy effect. Minimizes fixture visibility while highlighting material translucency, ideal for "luminous body" imagery in stained glass churches or modern glass box buildings.

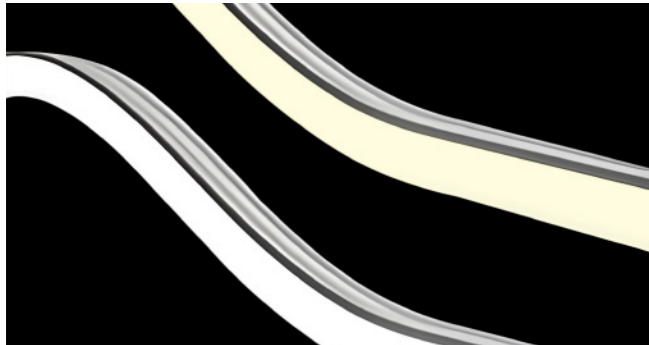

Lightbox

Combining diffused panels such as opal acrylic with LED backlight modules creates a uniform luminous surface, ideal for displaying graphics or decorative patterns. Features include high brightness and visual focus; content can be updated by replacing panels. Suitable for retail signage, subway wayfinding, and exhibition backdrops.

PAIN POINTS IN FACADE LIGHTING PRODUCTS

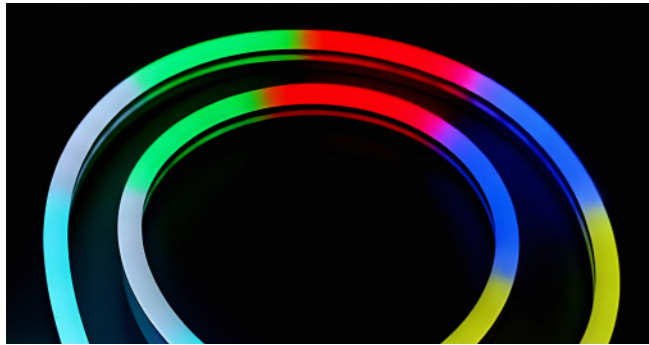

Light Output Issues

Inconsistent light color between different batches of the same model and configuration; mixing batches results in color deviation.

Low luminous efficacy; for façade lighting where higher brightness is needed, increased wattage leads to higher power consumption.

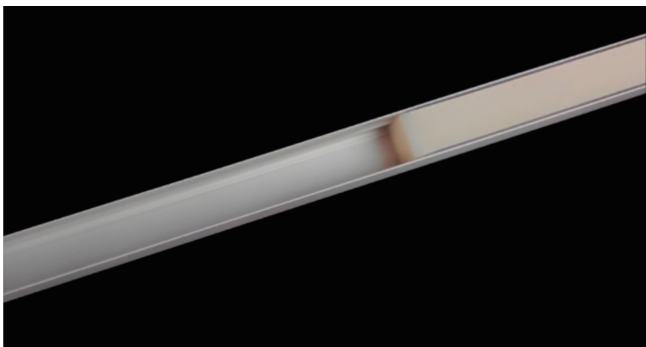

Dynamic RGB (chasing) effects lack smoothness

Installation Efficiency

Complex façade wiring and installation increase the risk of product damage during construction

Cutting units do not match the actual installation needs

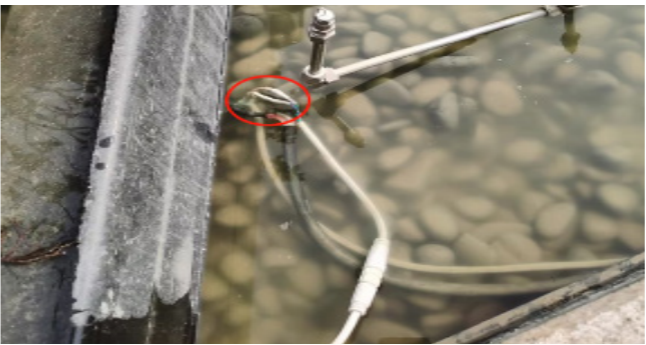

Weather Resistance

Performance limitations in extreme cold or hot weather conditions.

Yellowing of products after prolonged outdoor exposure.

Water ingress into cables during long-term outdoor use.

Reliability

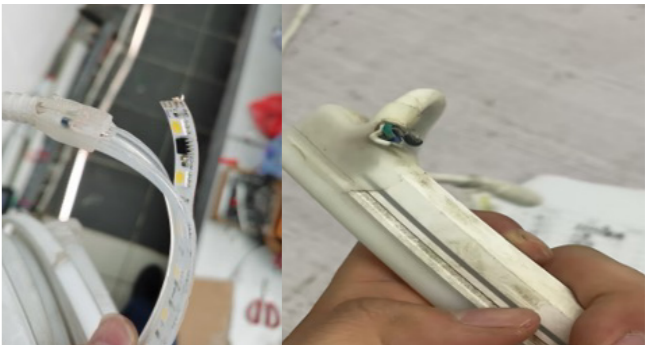

Large reels of neon flex may twist during installation, causing LED failures.

A single LED failure can cause a visible dark segment; the replacement cost for building façades is high.

PCB fracture caused by profile misalignment, vertical hanging load, or incorrect installation results in partial dark segments.

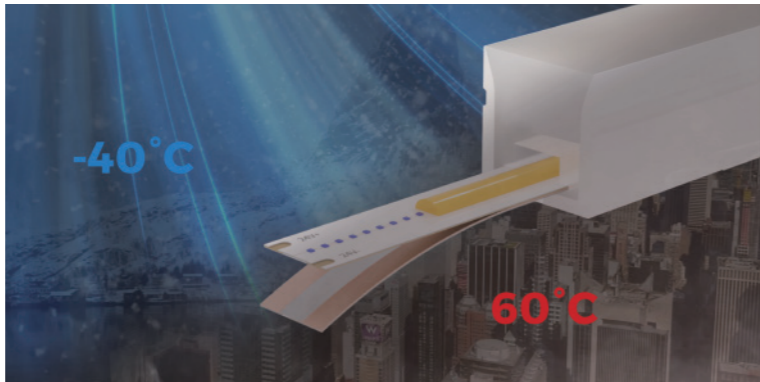

Cable ends may break under tension during installation or use.

CORE TECHNOLOGIES OF COLORS PRODUCTS

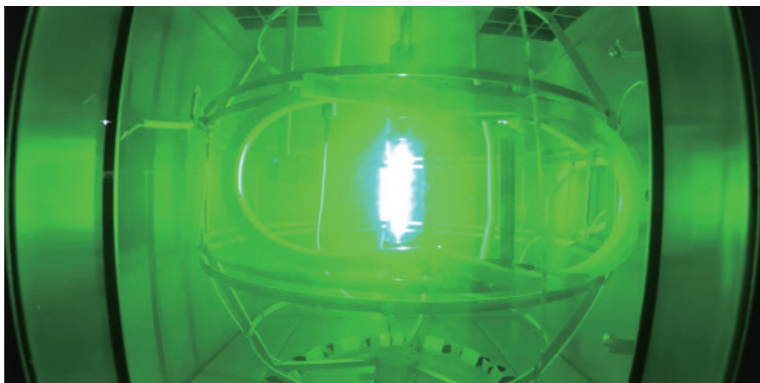

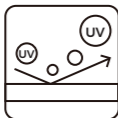

Super Weather Resistance

It withstands extreme cold and heat, resists UV-induced yellowing, and prevents siphonage phenomenon and water seepage.

Advanced Flip-Chip Technology – Super Durable Under Extreme Cold and Heat working Situation
Worry free used in the environment of -40°C to +60°C.

Gas-Phase Silicone Extrusion Process – UV and Yellowing Resistance
High-intensity 3000 hours UV test, equivalent to 9 years of outdoor use, almost no yellowing.

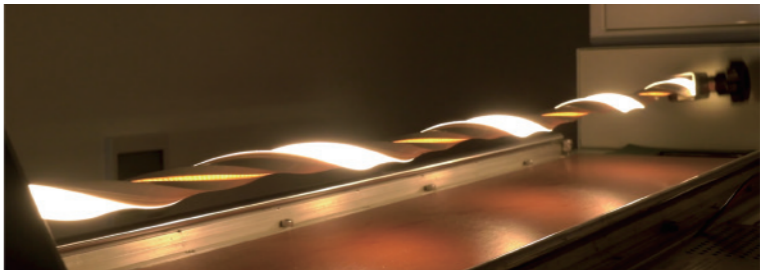

End cap & Cable outlet & Terminal wire Triple Protection – No Worry About Siphonage and Water Seepage
Uniform materials for the neon, end cap and terminal wire. Used integrated hot melt molding process, dual-layer protective terminal ensure IP67 protection against rain and water immersion.

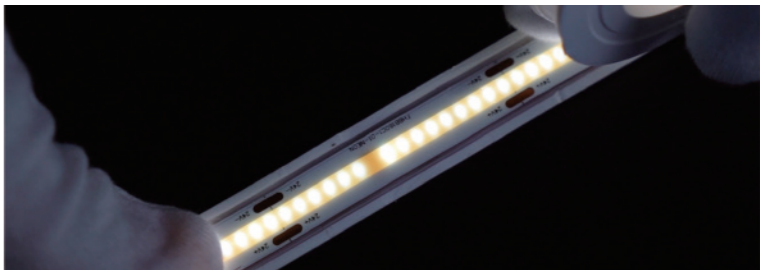

Super Durable

Anti-Dead Leds, Anti-breakage PCB, Anti- forceful tugging.

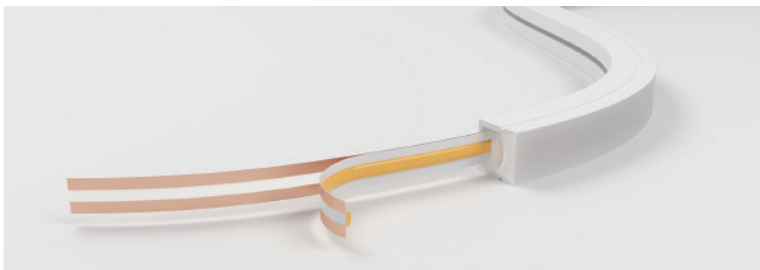

The AF Series adopts flip-chip LED technology, and anti-dead LEDs, ensuring superior mechanical performance.
It has passed a rigorous 720° torsion test repeated 5,000 times.

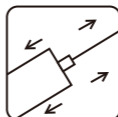

Dual Chips Parallel LEDs Technology – Anti-Dead Chips Without Dark Area
Special chip design, single chip breakage no affect the light effect.

The R2R production process reduces soldering points and incorporates a dual power supply system with a back wiring board. Even if a segment is damaged, power delivery remains unaffected, and the LED strip continues to function normally.
The back wiring process also enables the product to pass a 650N tensile strength test.

Reinforced Wire Soldering Technology – Withstands Installation Stresses
Designed to overcome external forces such as pressing, pulling, and tugging during installation.

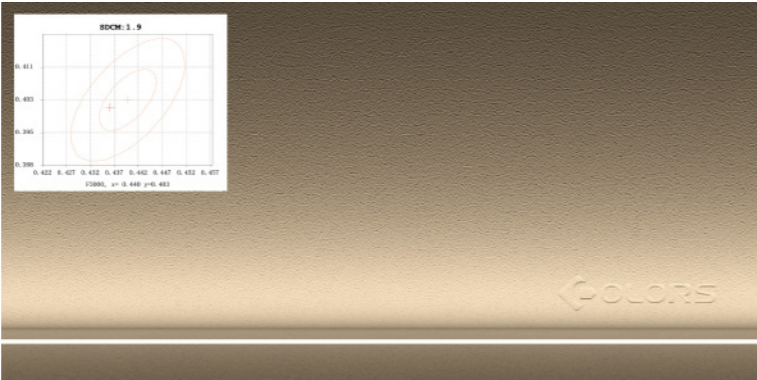

CORE TECHNOLOGIES OF COLORS PRODUCTS

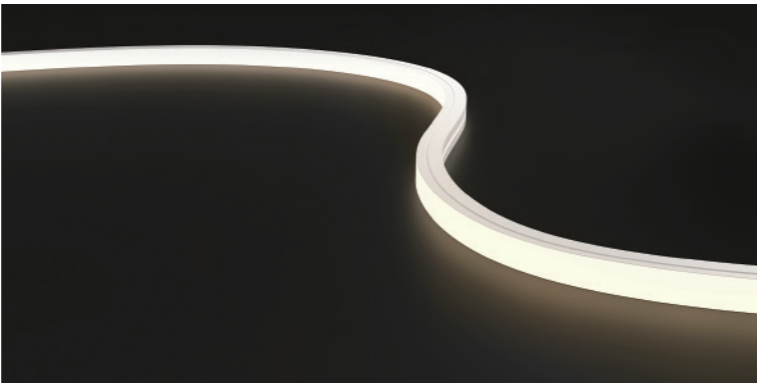

Superior Light Quality

Uniform, soft and consist color, smooth dynamic color effects.

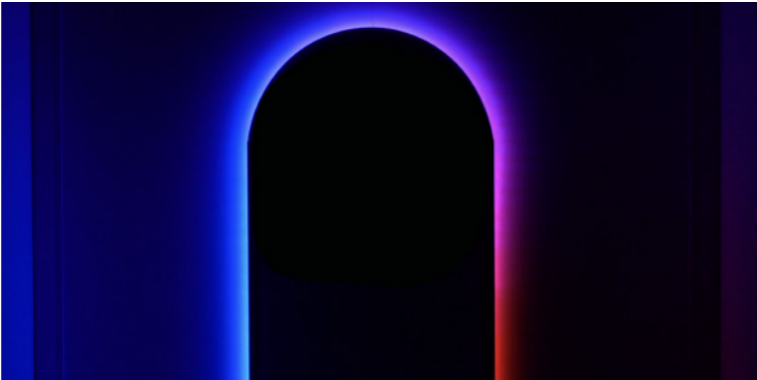

Precision-Controlled Color Temperature After Silicone Coated
SDCM<5, ensuring color consistency.

Upgraded Light-Emitting Structure, Even Color Without Dark Area On Surface

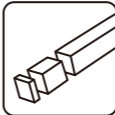

65536 Level Grayscale – compatible with all kinds of DMX system
DMX compatibility upgrade, multiple controller brands used freely

Free Cutting & Energy Efficiency Ultra-Long Use

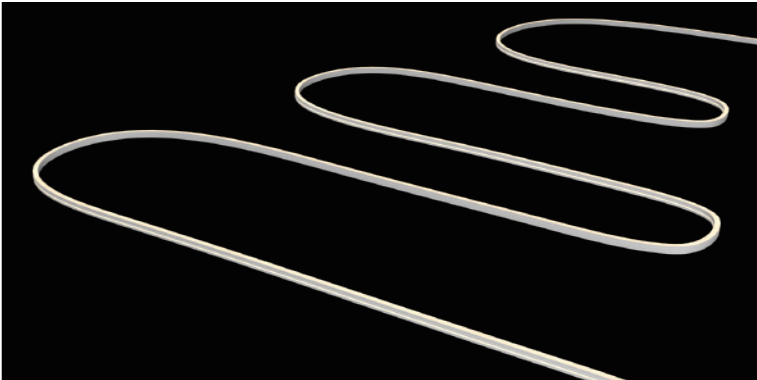

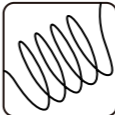

Cut-to-Size · Accurate Fit for Easy Installation
DC24V single Led cutting, precise to 6.25mm, with length customization unlimited by cutting units

Triple Efficiency Boost · Ultra High Light Efficiency & More Energy Saving
High-efficiency LEDs + Patented Optical Design and Material Formulation ,
The maximum light efficiency is 110 lm/W, increasing the brightness by 60%, and 40% energy savings.

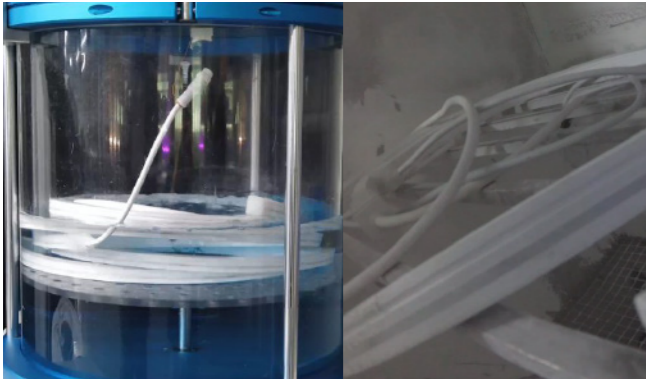

White Light:
50 meters, RGB/DMX: 20 meters

FACADE LIGHTING TESTING AND CERTIFICATION

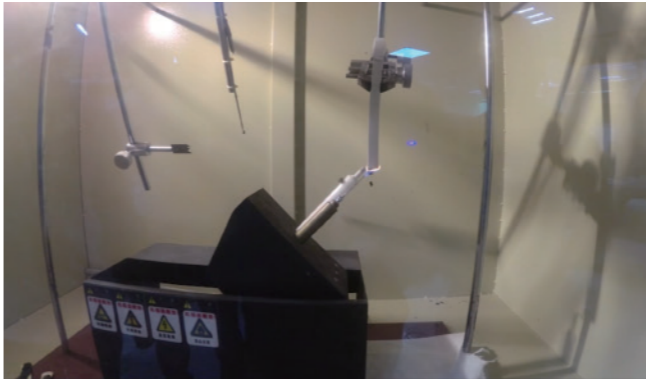

COLORS outdoor lights are designed with top-tier IP waterproof and dustproof ratings, high IK impact resistance, and precision anti-corrosion structure and processes. They have passed stringent tests for temperature rise, salt spray, and vibration resistance, ensuring long-term stability under harsh outdoor conditions.

Recommendation Reasons

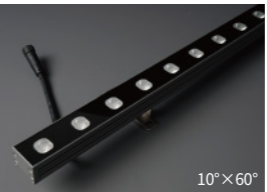

1. For high-rise buildings, recommend large luminous surface products for optimal viewing distance.
2. Excellent weather resistance of AF Series.
3. Rich CCT and control options.
4. Supports ultra-long cascading for easier installation.
5. White light products are typically used for outlining illumination; RGB and dynamic products are preferred for decorative and atmosphere lighting.

Wall Washing / Grazing Lighting

AL3D2722

P154

HW-WB

ACS1224

P130

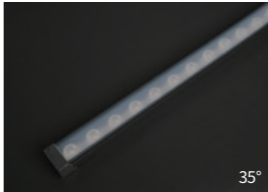

ACT1312

P134

Recommended Reasons

1. For mid-rise buildings, mid-size luminous surface products are recommended, and the viewing distance is moderate.
2. In harsh environments, the AF Series is recommended for its strong weather resistance and wide range of color temperature options.
3. In standard environments, the AC Series is recommended for its 50 m ultra-long cascading capability, driver-free operation, and ease of installation.
4. White-light products are generally used for outlining and façade illumination, while RGB and RGB dynamic products are primarily for decorative and ambient lighting.

PRODUCT SYSTEM

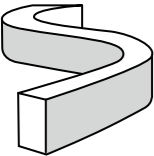

COLORS Lighting's protective low-voltage LED Strips and Neon Strips lights are widely used in outdoor architectural façade lighting and landscape illumination. Driven by the mission of creating an ideal lighting environment for the world, COLORS has successfully delivered hundreds of high-quality outdoor lighting projects in major cities worldwide over the past decade. We have built a strong reputation for excellent color and light performance, superior weather protection, and long-lasting quality, along with providing a complete Architectural Façade Linear Lighting Integrated Solution.

COLORS Lighting's architectural façade linear lighting products include protective LED strips for ambient base lighting, Neo Strips for contour outlining and dynamic illumination, as well as flexible lens strips and linear wall washers for wall washing and grazing effects. Based on differences in building scale, viewing distance, lighting design techniques, and desired visual effects, each product category has been further refined into distinctive series such as the AF Series of weather-resistant, the AH Series of high-luminous-efficacy and freecutting, the CSP-Dot Series of tensile- and torsion-resistant protective LED Strips, and 3D flexible wall washers bendable in any direction.

AF Weather Fastness Series

Model Recommendation

AFT1312 AFT1615 AFT1616 AFT2020
AFS1217 AFS1224 AFS1616 AFS2020

Core Feature Advantages

Super Weather Resistance, -40~+60°C
Suitable for extremely cold / extremely hot regions

650N
Pulling test

>5000 times
720° twist

>1500 cycles
Thermal shock test

3000H
UV test

SDCM<5
ANSI C78.377

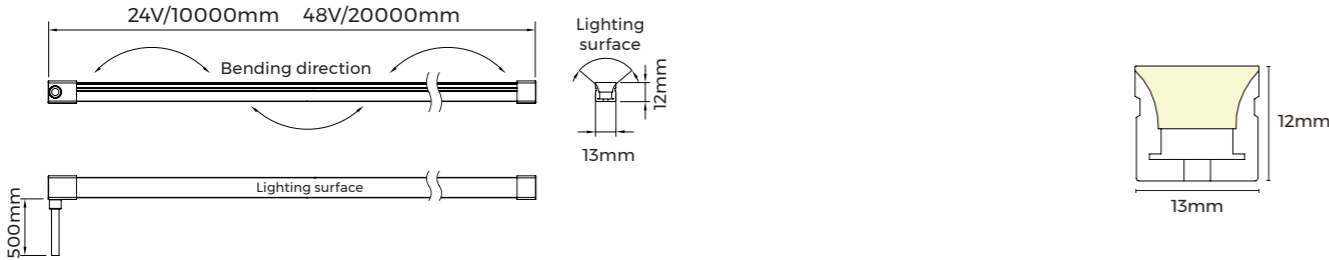

AFTI312

Light source	Adopting dedicated and outdoor-specific LED, stronger reliability for outdoor application; Double-layer circuit conductive, double power supply guarantee, broken boards without power cut;
Structure	New anti-tension structure, Integrated anti-tension silicone extrusion process, against internal stress and external tension
DMX Chip	White light/RGB/RGBW: UCS512H4LB, 65536 level grayscale effect
Pixel count	12 Pixels/m
IP	IP67
Product applications	Outdoor illumination, architectural facade lighting
Working temperature	White/monochromatic light: -40~60℃, DMX/RGB/RGBW: -40~50℃
Storage temperature	0℃~60℃
Warranty	White/R/G/B with 7 years warranty or working life =84000H, whichever comes first RGB/RGBW/RGBM/RGBWM/White(DMX) with 5 years, warranty or working life=60000H, whichever comes first

Dimension: 1000x14.6x19.35mm
screw model: KA-M4
screw QTY: 2 PCS

Moldable groove

Order model: AS-NMSI2I7M1-500
Dimension: 500xW13xH17mm
screw model: KA-M4
screw QTY: 8 PCS

* Cannot be mounted with the illuminated side facing down

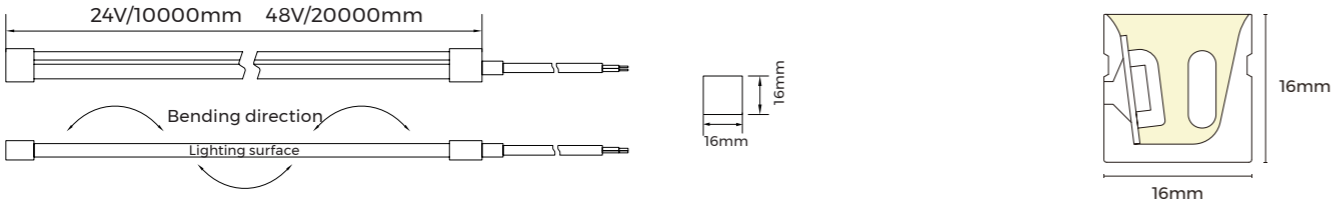

AFS1616

Light source	Adopting dedicated and outdoor-specific LED, stronger reliability for outdoor application; Double-layer circuit conductive, double power supply guarantee, broken boards without power cut;
Structure	New anti-tension structure, Integrated anti-tension silicone extrusion process, against internal stress and external tension
DMX Chip	White light/RGB/RGBW: UCS512H4LB, 65536 level grayscale effect
Pixel count	12 Pixels/m
IP	IP67
Product applications	Outdoor illumination, architectural facade lighting
Working temperature	White/monochromatic light: -40-60℃, DMX/RGB/RGBW: -40-50℃
Storage temperature	0℃~60℃
Warranty	White/R/G/B with 7 years warranty or working life =84000H, whichever comes first RGB/RGBW/RGBM/RGBWM/White(DMX) with 5 years, warranty or working life=60000H, whichever comes first

ANSI C78.377

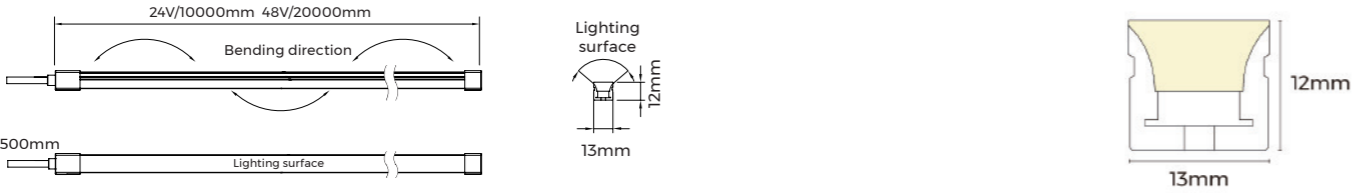

AHT1312

Light source	High luminous efficiency LED, 24V free cutting; Double power supply guarantee, broken boards without power cut
Structure	New anti-tension structure, Integrated anti-tension silicone extrusion process, against internal stress and external tension
Process material	three-color silicone extrusion technique is applied, Cut as your wish
IP	IP67
Product applications	Signboard lighting, outdoor/internal decorative lighting, architectural contour application
Working temperature	-20-50℃
Storage temperature	0℃~60℃
Warranty	7 years warranty

AHT1616

Light source	High luminous efficiency LED, 24V free cutting; Double power supply guarantee, broken boards without power cut
Structure	New anti-tension structure, Integrated anti-tension silicone extrusion process, against internal stress and external tension
Process material	three-color silicone extrusion technique is applied, Cut as your wish
IP	IP67
Product applications	Signboard lighting, outdoor/internal decorative lighting, architectural contour application
Working temperature	-20~50℃
Storage temperature	0℃~60℃
Warranty	7 years warranty

Model Recommendation

ACS1217 ACS1224 ACT1312

Core Feature Advantages

Driver-free,50m Ultra Long,Lightning Resistant

ACS1217

Light source	Adopting dedicated and outdoor-specific LED, stronger reliability for outdoor application
Structure	New anti-tension structure, Integrated anti-tension silicone extrusion process, against internal stress and external tension
Safety chip	Dual safety redundancy design for enhanced protection.
IP	IP65
Product applications	outdoor illumination, architectural facade lighting
Working temperature	-20~50℃
Storage temperature	0℃~60℃
Warranty	5 years warranty
Kind reminder	Strongly recommended to equip a lightning protection module

TECHNICAL SUPPORT & SERVICES

Architectural façade lighting involves a systematic design of artificial light on building exteriors to reshape their nighttime appearance. The implementation process is long and complex, involving many stakeholders. Issues in early design, product selection, mid-stage construction, or later maintenance can prevent achieving or sustaining the ideal lighting effect.

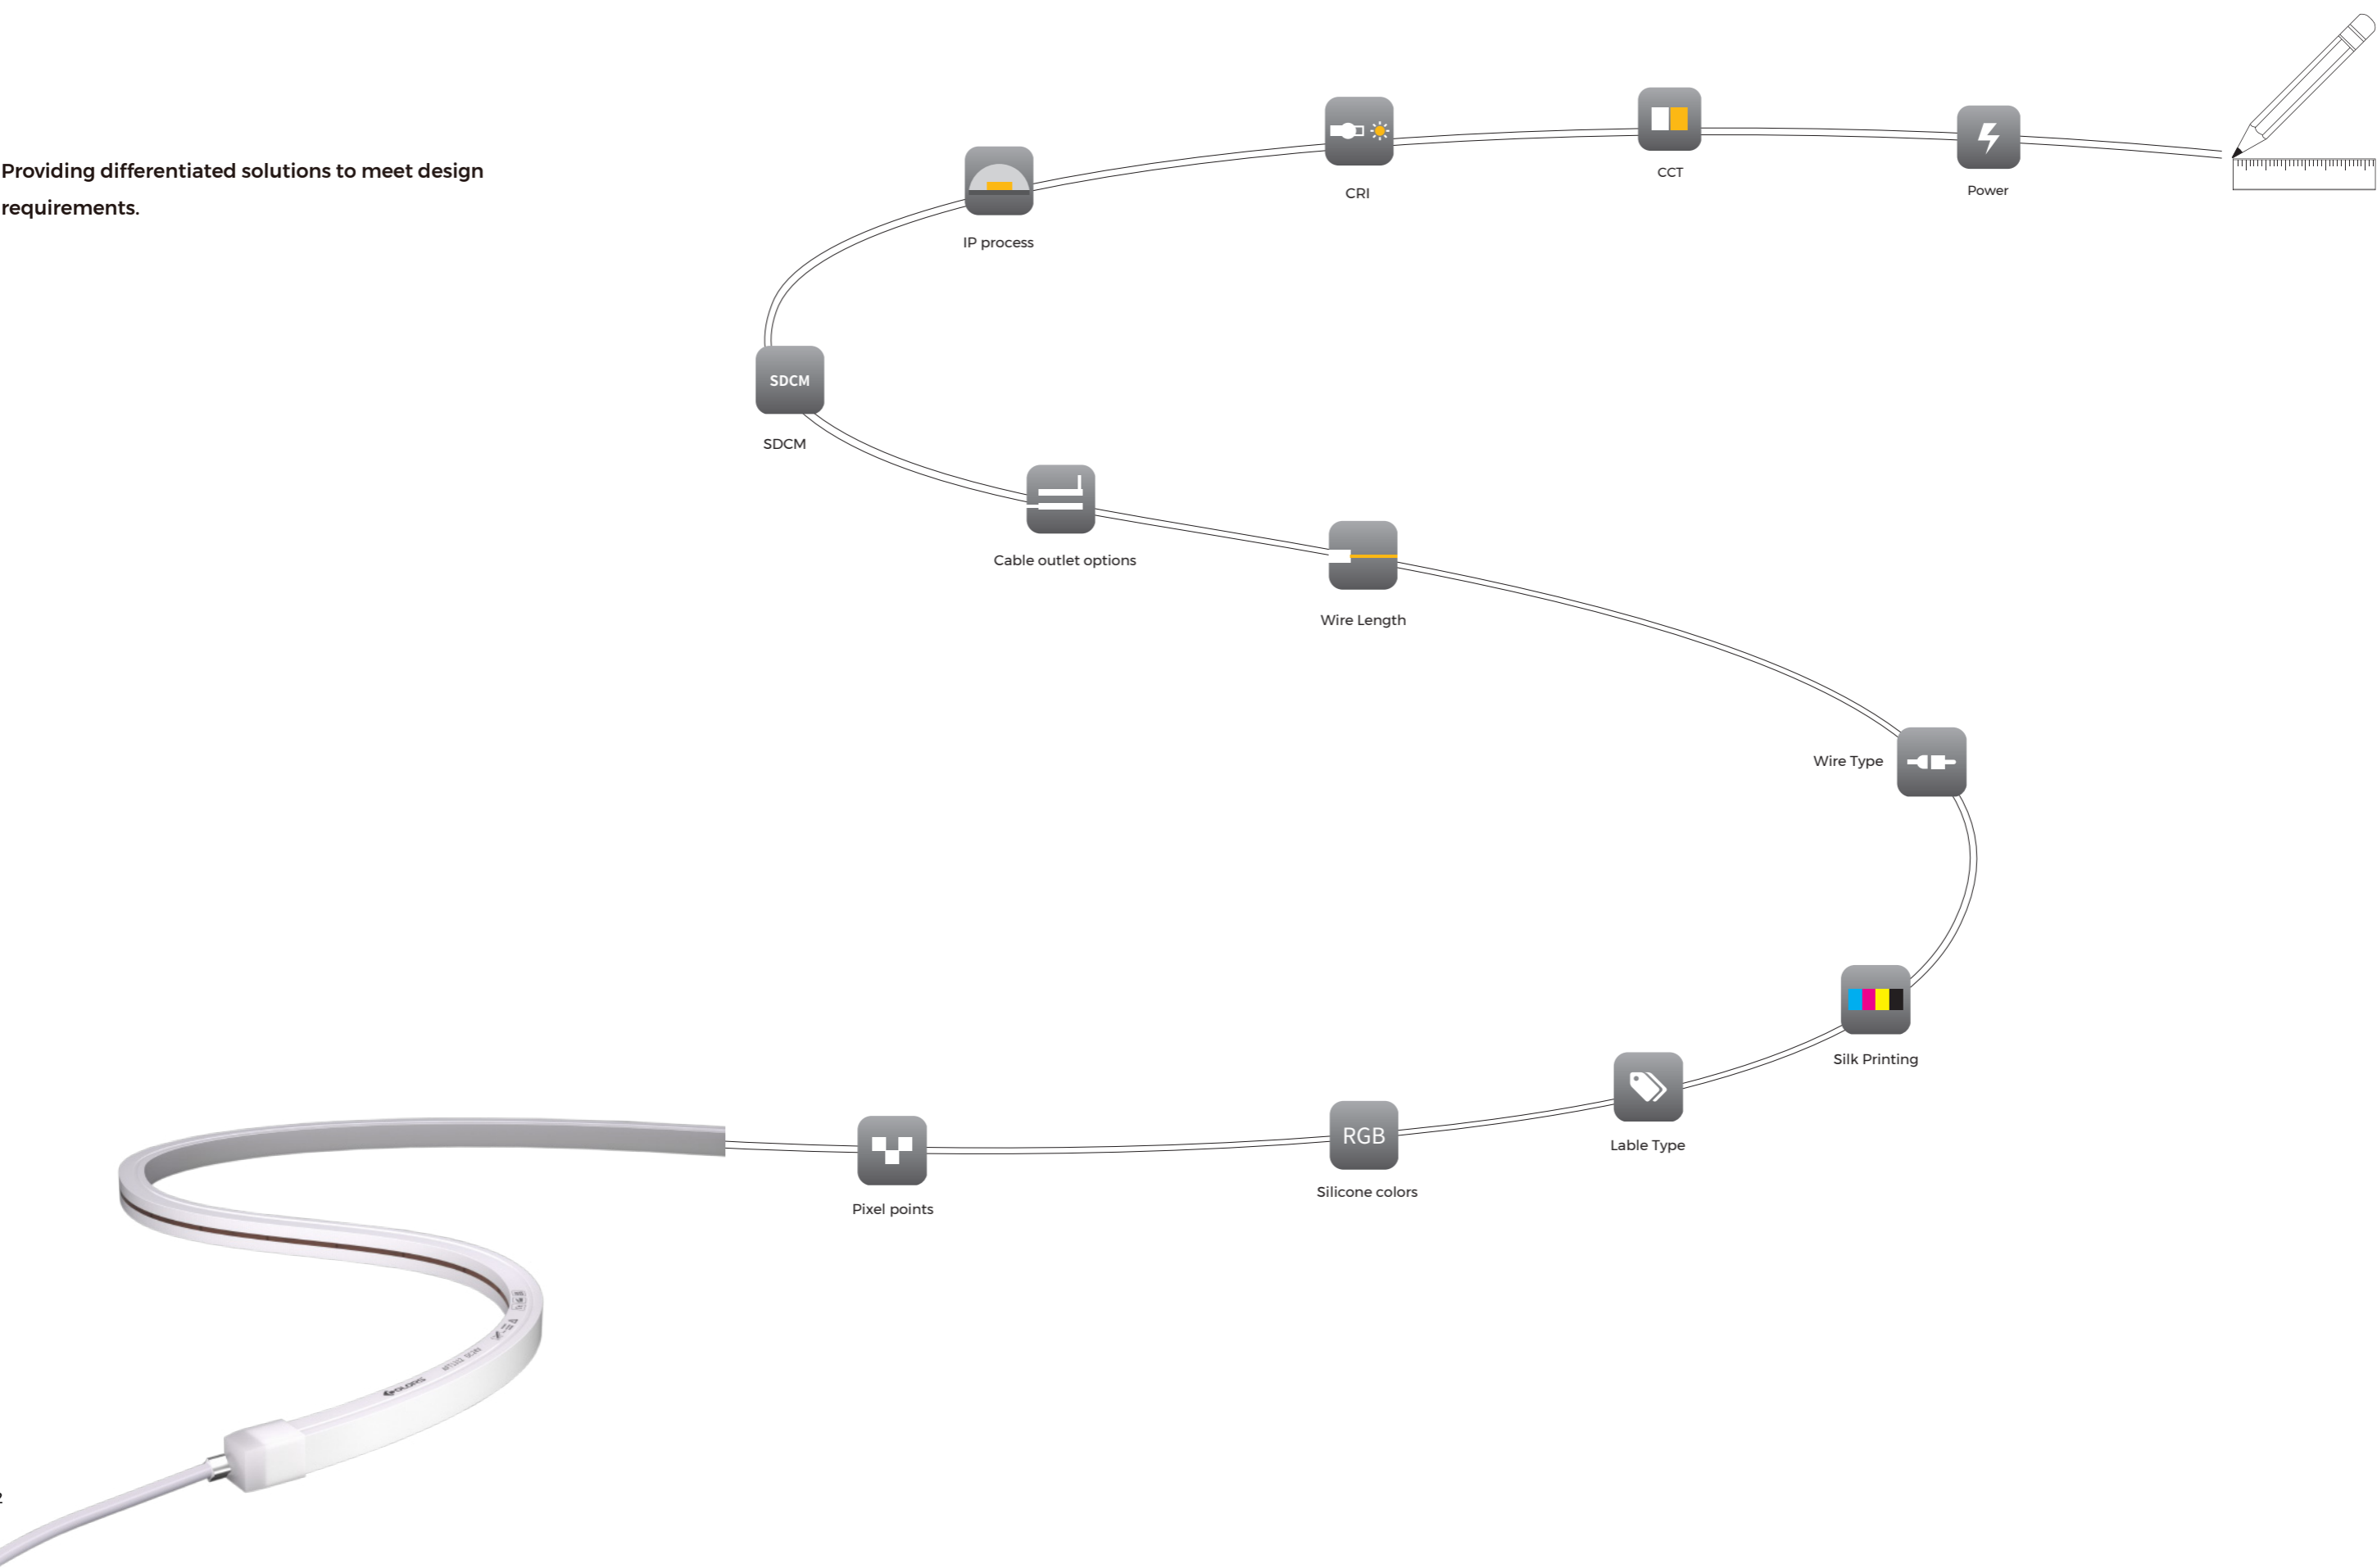

To ensure the realization and delivery of the desired final lighting effect, COLORS Lighting not only provides high-quality products with rapid delivery but also offers comprehensive technical support and supplementary services throughout the entire project process. These include product selection based on lighting design requirements, customized differentiated solutions, drawing refinement support, and sample testing based on project progress, technical briefings, installation guidance, and commissioning assistance during the construction phase, as well as fault diagnosis and repair assistance during after-sales service.

FULL-PROCESS PROJECT SERVICES

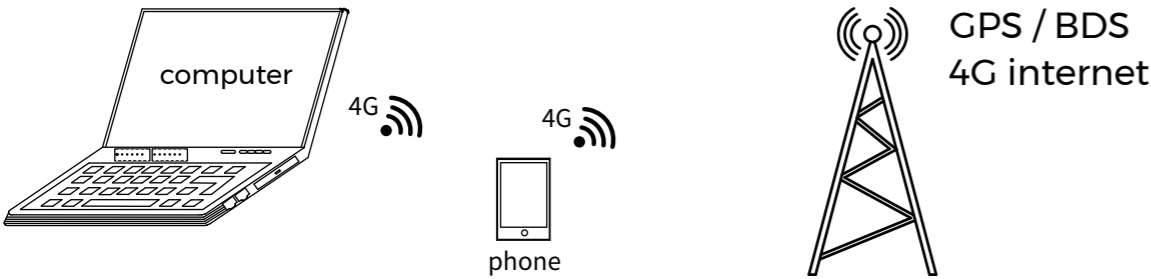

DESIGN DEFINITION

Providing differentiated solutions to meet design requirements.

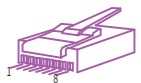

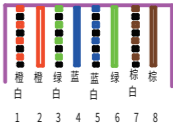

PROJECT DRAWINGS

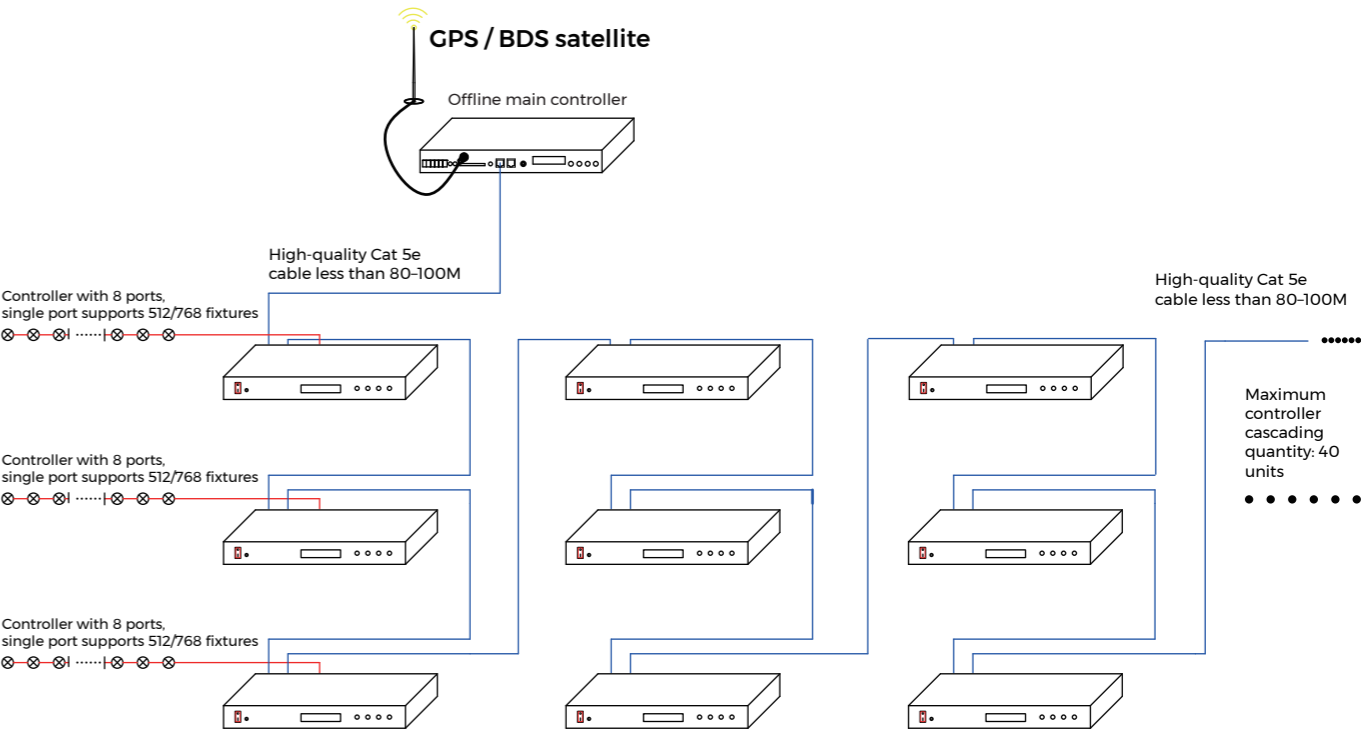

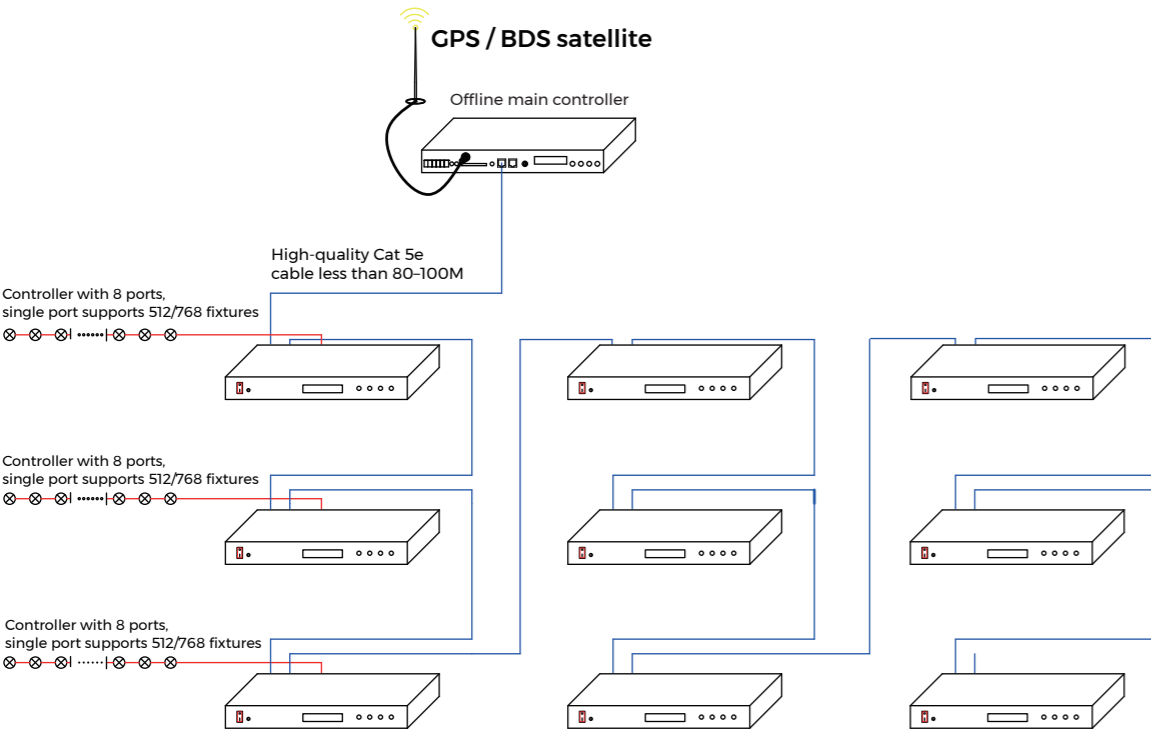

Remarks:

Between the computer and the switch, between the switch and the main controller, and between the main controller and the sub-controllers, the standard TCP/IP network protocol is adopted, using high-quality Cat 5e straight-through network cables for cascading. The connection length between controller devices should not exceed 100m; for distances over 100m, add a switch or use optical fiber for long-distance transmission. RJ45 connectors should be wired using the 568B standard. The offline main controller can connect up to 60 sub-controllers / 160,000 pixel points (for optimal signal transmission, approximately 120,000 pixel points is recommended). Maximum pixel output per controller port: 512 (DMX512 IC) / 768 (serial IC or breakpoint-resume IC). Controller port output - DMX512 fixture signal, cable length from port to fixture end should not exceed 100m. Controller port output - TTL fixture signal, cable length from port to fixture head should not exceed 20m.

RJ45 connector wiring method

PRODUCT SUPPLY

Material Supply Management

Strictly select high-quality suppliers to ensure that the lighting fixtures, cables, and other products used comply with national standards and industry specifications, and have excellent performance and reliability. Conduct strict quality inspections on all procured products to prevent substandard products from entering the project site.

Product Quality Control and Inspection

Appoint dedicated quality supervisors to carry out strict inspections at every stage of the production process, rigorously controlling manufacturing procedures to ensure that all factory-delivered lighting products meet the required quality standards

Project Section Packaging and Labeling

Package products according to the project section and floor level to facilitate on-site installation.

INSTALLATION GUIDANCE

Installation Guidance and Training

Provide training to construction personnel on installation precautions and technical guidance through online or offline channels. Demonstrate in detail the installation steps and methods for lighting fixtures, including drilling, fixing brackets, and assembly, disassembly precautions, to avoid product damage caused by rough handling. Teach installation techniques to ensure fixtures are securely mounted and capable of withstanding various weather conditions.

On-Site Wiring & Connection

Explain how to plan wiring routes based on fixture layout and power requirements. Choose suitable cable specifications and models to ensure safety and stability. Introduce wiring standards and requirements, such as conduit installation and cable tray fixing, to avoid cable crossing, tangling, and signal interference. Demonstrate correct wiring connection methods such as using terminals, soldering, and insulation wrapping, emphasizing waterproof treatment of connection points to prevent leakage and short circuits.

ON-SITE SUPPORT

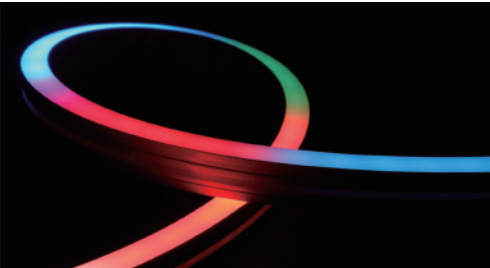

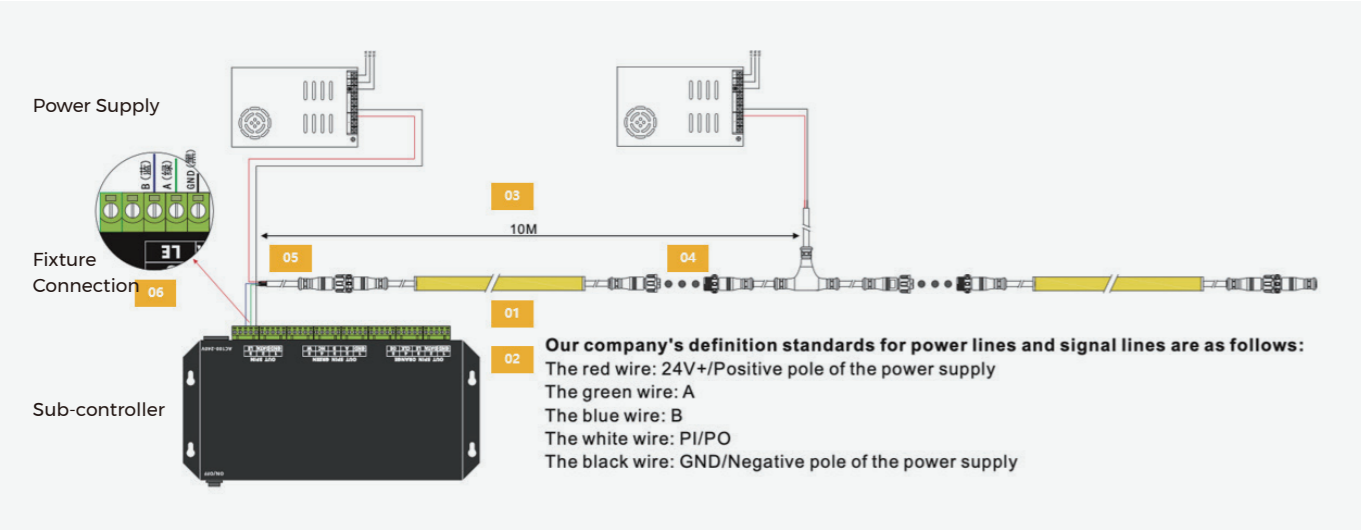

For key engineering projects, collaborate with designers and contractors to refine pre-sales product application solutions, providing documentation for product selection, wiring diagrams, circuit control layouts, and installation nodes. Assist with technical briefings before installation, provide on-site technical support during installation, and cooperate with effective commissioning and fault troubleshooting to ensure smooth project delivery and provide prompt, reliable after-sales support.

KNOWLEDGE Q&A

Dynamic Façade Lighting – Technical Highlights on DMX512 RGB Neon Strip Applications

Wiring Schematic Diagram for a Single Standalone Offline Device

1. DMX512 RGB Neon Strips – Pixel Definition and Segmentation

Definition of Pixel:
A pixel is the smallest independently controllable light-emitting unit on an LED fixture.
Full-color fixtures: Each pixel point is composed of R/G/B (3 channels) or R/G/B/W (4 channels).
Monochrome fixtures: Each pixel point consists of 1 channel or multiple channels of the same color.

The relationship between pixel, point, and segment:
Pixel, point, and segment are commonly interchangeable terms depending on the fixture type.
Point Light Source: A point light source has only one pixel as its color rendering unit, hence the term "point."
Linear Light: Each fixture consists of multiple segments, with one segment being the smallest color rendering unit, hence the term "segment."

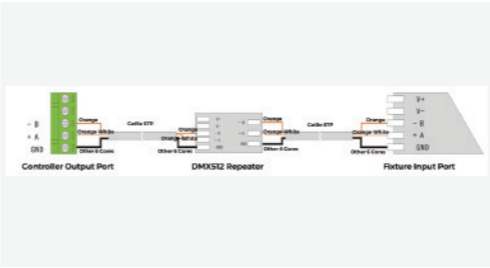

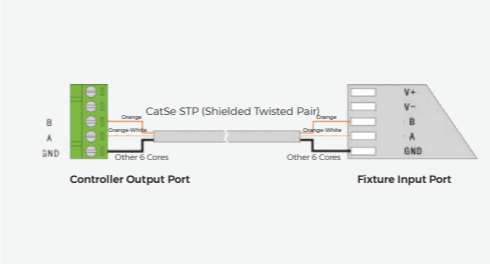

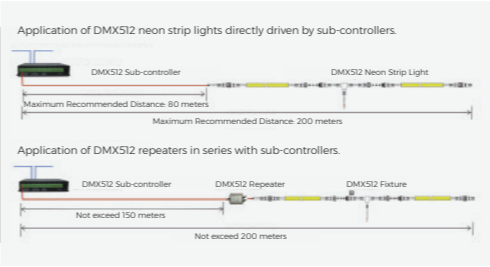

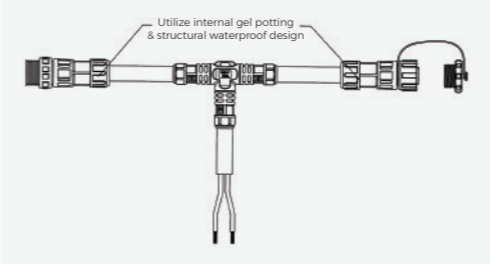

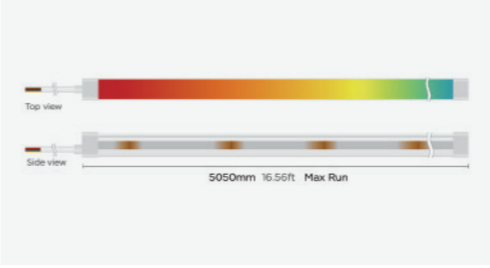

The significance of pixel display units:
As display units, the more pixels there are, the finer the display resolution:
≥4 segments/meter: enables flowing light effects.
≥8 segments/meter: allows video display effects.
The larger the display unit and unit spacing, the farther the optimal viewing distance.

2. DMX512 RGB Neon Strips – Control IC Models and System Compatibility

The USITT DMX512-1990 is an international standard protocol, compatible with all compliant fixtures. Most ICs on the market support both the DMX512-1990 and its extended versions.

Main Differences – Addressing Protocols:
Different chip manufacturers and models may have variations in the specific implementation of the address writing protocol.

3. DMX512 RGB Neon Strips – Cascading Length and Power Supply Considerations

In project applications, the cascading length of RGB neon strips primarily depends on two factors:
Voltage Drop: Excessive length causes brightness inconsistency due to voltage loss.
Controller Output Capacity: Limited by how many pixels a port can control.

If the controller port's load capacity length exceeds the supply voltage drop limit length, the cascading length should be based on the supply voltage drop limit load capacity length. Conversely, if the port's load capacity length does not meet the requirement, it should be adjusted accordingly.

4. DMX512 RGB Neon Strip – Direct Connection, T-Connectors, and Waterproofing

Our waterproof male/female connectors utilize dual protection, internal gel potting, and structural waterproof design, and this ensures they meet the IP67 waterproofing standard.

This design demonstrates outstanding reliability and stability in outdoor engineering projects, effectively resisting rainwater, moisture, and dust intrusion, offering long-term stability in complex outdoor environments.

5. Distance Between Sub-controllers and Fixtures & RP Repeater Application

DMX512 Protocol:
The maximum recommended distance between the controller and the first pixel of the fixture is 80 meters.
If the distance exceeds this limit, signal attenuation may occur, and a repeater can be used to amplify the signal. The maximum recommended cable length should not exceed 150 meters. The total distance from the first to the last control unit in the DMX signal chain should not exceed 200 meters.

6.1 DMX512 System – Signal Wiring Guidelines

- For long-distance connections between the controller and fixture, use RS485 cable or Cat5e shielded twisted pair (STP). The optimal wiring configuration is as follows: Orange–B; Orange-White–A; all other wires should be connected to GND (ground).
- Place a 120Ω termination resistor between A and B at the end of each signal line.
- Never use two twisted wires simultaneously for signal connections, such as connecting both orange and orange-white wires to either A or B.

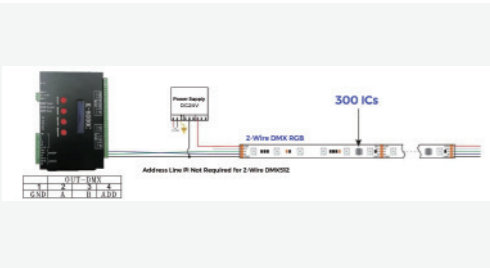

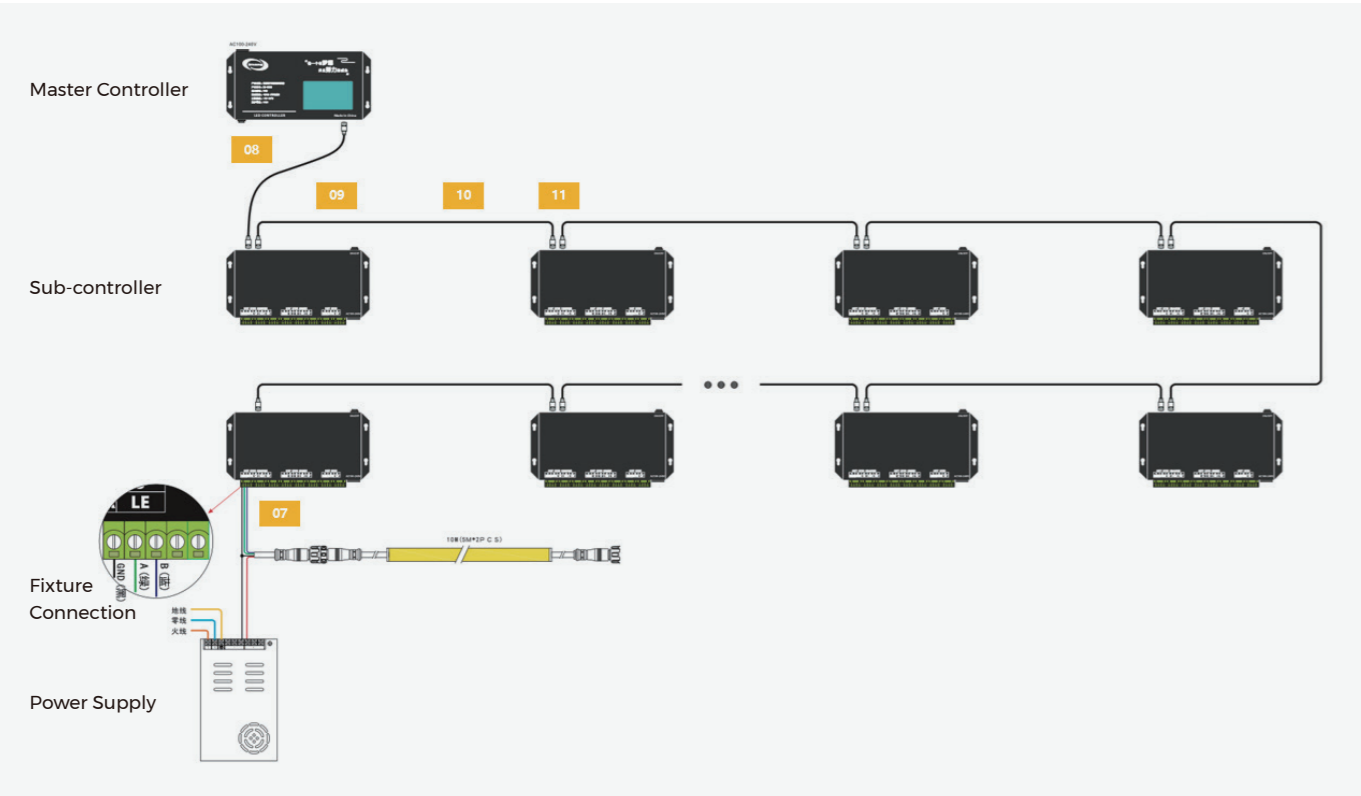

6.2 DMX512 Signal Repeater – Wiring Guidelines

- For long-distance connections between the controller and fixture, add a DMX repeater before the first pixel, use RS485 cable or Cat5e shielded twisted pair (STP). The optimal wiring configuration is as follows: Orange–B; Orange-White–A; all other wires should be connected to GND (ground).
- Place a 120Ω termination resistor between A and B at the end of each signal line.
- Never use two twisted wires simultaneously for signal connections, such as connecting both orange and orange-white wires to either A or B.

KNOWLEDGE Q&A

Dynamic Façade Lighting – Technical Highlights on DMX512 RGB Neon Strip Applications

Integrated Connection and Disconnection Control Architecture

7. How Many Pixels Can One Offline Sub-Controller Handle?

Standard DMX512-1990 Protocol

Dynamic white light: Each port can support a maximum of 512 pixels, so an 8-port sub-controller can support $512 \times 8 = 4,096$ pixels.
RGB Color: Each port can support a maximum of $512 \div 3 \approx 170$ pixels, so an 8-port sub-controller can control $170 \times 8 = 1,360$ pixels.
RGBW Color: Each port can support a maximum of $512 \div 4 = 128$ pixels, so an 8-port sub-controller can control $128 \times 8 = 1,024$ pixels.

Extended DMX512 Protocol:

Dynamic white light: Each port has a maximum load capacity of 1536 pixels. To ensure smooth video performance, it is recommended not to exceed 900 pixels per port. Therefore, an 8-port controller is recommended to load $900 \times 8 = 7200$ pixels.
RGB Color: Each port has a maximum load capacity of $1536 \div 3 = 512$ pixels. To ensure smooth video performance, it is recommended not to exceed 300 pixels per port. Therefore, an 8-port controller is recommended to load $300 \times 8 = 2400$ pixels.
RGBW Color: The maximum load per port is $1536 \div 4 = 384$ pixels. To ensure smooth video performance, it is recommended that the load does not exceed 225 pixels. Therefore, an 8-port controller is recommended to have a load of $225 \times 8 = 1800$ pixels.

8. How Many Sub-Controllers Can One Master Controller Manage?

Factors affecting the load capacity of a master controller (offline master controller):

The load capacity of a master controller is not determined by the number of sub-controllers it supports, but by the number of pixels it supports.

Number of pixels supported by the master controller (offline master controller):

Generally, master controllers on the market support around 120,000 pixels. For example, the MR-BF12B supports 150,000 pixels.

Calculation Formula:

No. of Sub-Controllers = Master Pixel Capacity \div (Pixels per Port \times No. of Ports per Sub-Controller)

Examples:

Standard DMX512-1990: $150,000 \div (170 \times 8) \approx 111$ units

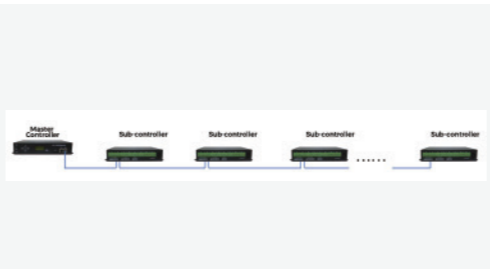

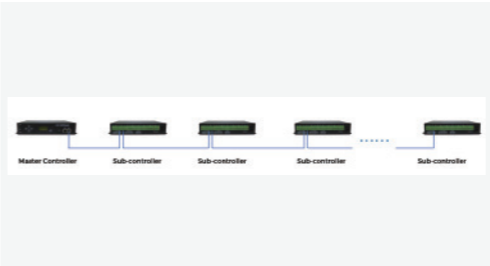

Extended DMX512: $150,000 \div (512 \times 8) \approx 37$ units

Empirical value for the number of sub-controllers that can be daisy-chained to a master controller

Generally, the number of sub-controllers that can be daisy-chained to a master controller should not exceed 30 units.

What if there are more than 30 sub-controllers?

A network switch can be added between the master controller and sub-controllers. Each group of 30 sub-controllers can be daisy-chained into one group, and multiple groups of sub-controllers can be divided via the switch.

9. What Cables Are Used Between Controllers? What Is The Cable Length?

Communication data between controller devices:

Communication data is transmitted between controller devices (including master controllers and slave controllers) using the standard UDP network protocol.

Wiring and Connectors:

Cables are typically Category 5e twisted-pair cables, and interfaces use standard RJ-45 network connectors (commonly known as "crystal heads").

Cable Length Limitations:

Max distance per Cat5e cable should not exceed 100 meters.

RJ-45 Wiring Standards:

Generally divided into 568A and 568B. Straight-through cables have both ends configured as 568B, while crossover cables have one end as 568A and the other as 568B.

Generally, crossover cables have better interference resistance than straight-through cables.

10. What If the Network Cable Between Control Devices Exceeds 100 Meters?

Solution: Optical Fiber Transmission

Since the system uses standard network protocols, fiber optic networks can be directly integrated.

Fiber Types:

Single-mode: transmission distance of up to 15 km

Multi-mode: transmission distance of up to 550 meters

11. Network Cable Selection & Wiring Notes

- Use Cat5e or higher-grade network cables for signal transmission.
- Regarding network cable (Category 5e twisted pair) wiring sequences:
Network cable connectors use the 568A or 568B wiring sequences:
568A: Green-white, green, orange-white, blue, blue-white, orange, brown-white, brown
568B: Orange-white, orange, green-white, blue, blue-white, green, brown-white, brown
- For standard protocols, the transmission distance between controllers does not exceed 100 meters.
- Computers to the controllers: Use the 568B straight-through pinout. Controllers can use either a straight-through cable or a crossover cable (one end 568B, the other end 568A). If the distance between controllers is significant, it is recommended to use a crossover pinout.

Outdoor Lighting Needs And Trends

Outdoor lighting is a crucial application area that differs from indoor lighting. It serves many scenarios with different lighting requirements. This article gives an overview of outdoor lighting industry trends, including the application domains and customer needs. It also introduces reliable linear outdoor lighting products.

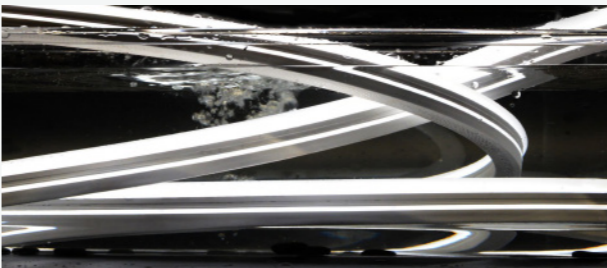

In-Depth Analysis of Outdoor Silicone Neon Flex Application Pain Points & ARCH NEON Series Solutions

In building facade lighting projects, commonly used products such as LED strip lights, silicone neon flex, linear wall washers, and DMX-controlled dynamic chase fixtures, to create stunning visual effects. However, they often have significant problems during the actual application, which can compromise project cost, quality and service life. The four main areas of concern are: 1. Weather Resistance Issues; 2. Long-term reliability concerns; 3. Optical performance defects; 4. Control system failures...

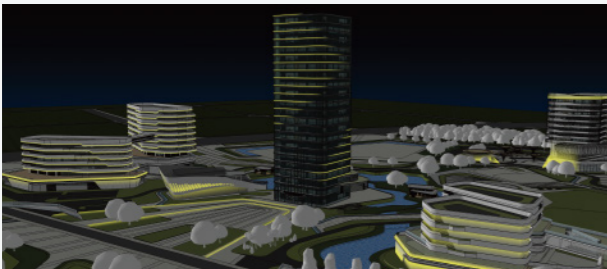

Common Issues, Causes, and Optimization Strategies in Architectural Façade Lighting Projects

Architectural facade lighting is designed to transform a building's nighttime appearance through artistic expression. It uses artificial light sources and systematic lighting design to emphasize the building's structural features, texture, and cultural connotations, while achieving harmonious integration into the urban environment. In actual engineering projects, however, problems can arise at various stages, including lighting design, product choice...

What Tests And Certifications Are Required for Reliable Outdoor Silicone Neon Flex Products?

Outdoor silicone neon flex is commonly used for exterior lighting applications, including building facades, landscape architecture, roads and bridges, and waterscape lighting. These products must endure harsh conditions and variable challenges during installation and throughout their lifespan, requiring exceptionally high standards of quality, reliability, and long-term stability. Therefore, comprehensive...

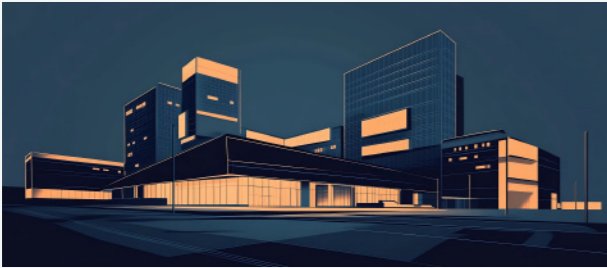

What Are The Main Lighting Methods And Products Used In Architectural Façade Lighting?

Architectural facade lighting is a crucial component of outdoor lighting applications. This article provides a comprehensive overview of the definition, lighting way, and products of architectural facade lighting to assist clients in selecting appropriate lighting methods and products for practical projects.

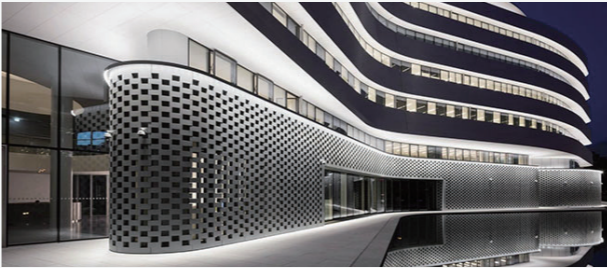

Dynamic Façade Lighting – 11 Technical Highlights on DMX512 RGB Neon Strip Applications

This article primarily introduces key technical points for applying RGB neon strip lights controlled by the DMX512 protocol in dynamic architectural façade lighting projects. It covers critical aspects, including product technology, installation, wiring, and control systems, to help establish a foundational understanding of practical DMX512 applications.

Building Facade Lighting: Techniques & LED Solutions

Building facade lighting is a technical approach involving systematic lighting design for the external surfaces of buildings using artificial light sources. Its primary objectives are to reshape a building's nighttime image through artistic expressions of light, highlight its morphological features, material textures, and cultural connotations, while achieving harmonious coexistence with the urban environment.

11 Best Outdoor LED Neon Lights For 2025 (Weatherproof & Bright)

Lighting designers and architects are increasingly choosing outdoor LED neon lights for their reliability, durability and brightness. These lights are flexible, offer energy efficiency, excellent brightness, and have a strong visual impact. They can be used to light up architectural features, create atmosphere on rooftops or gardens, or illuminate facades. This article will highlight 11 of the best weatherproof and bright outdoor LED neon lights...
